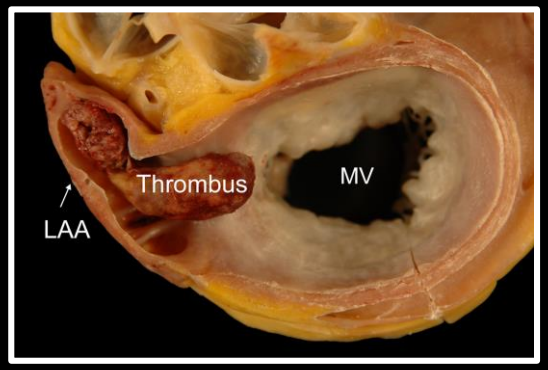
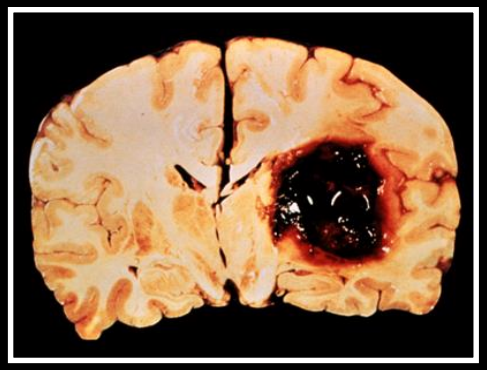
Stroke Prevention in Atrial Fibrillation and Previous Intracerebral Hemorrhage





Ashkan Shoamanesh, MD, FRCPC

Assistant Professor of Medicine (Neurology)

Director, Stroke Fellowship Program

Marta and Owen Boris Chair in Stroke Research and Care

McMaster University

PHRI

Hamilton Health Sciences

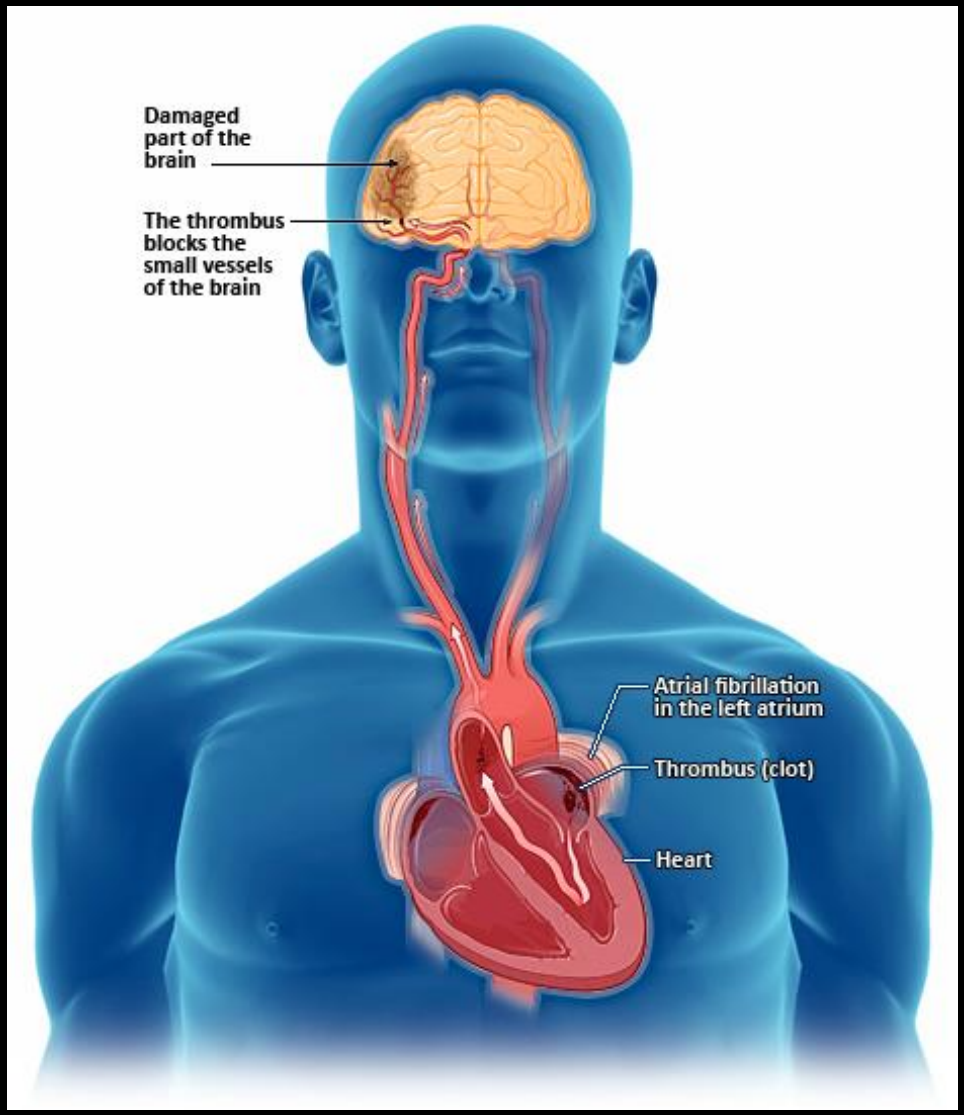
Objectives

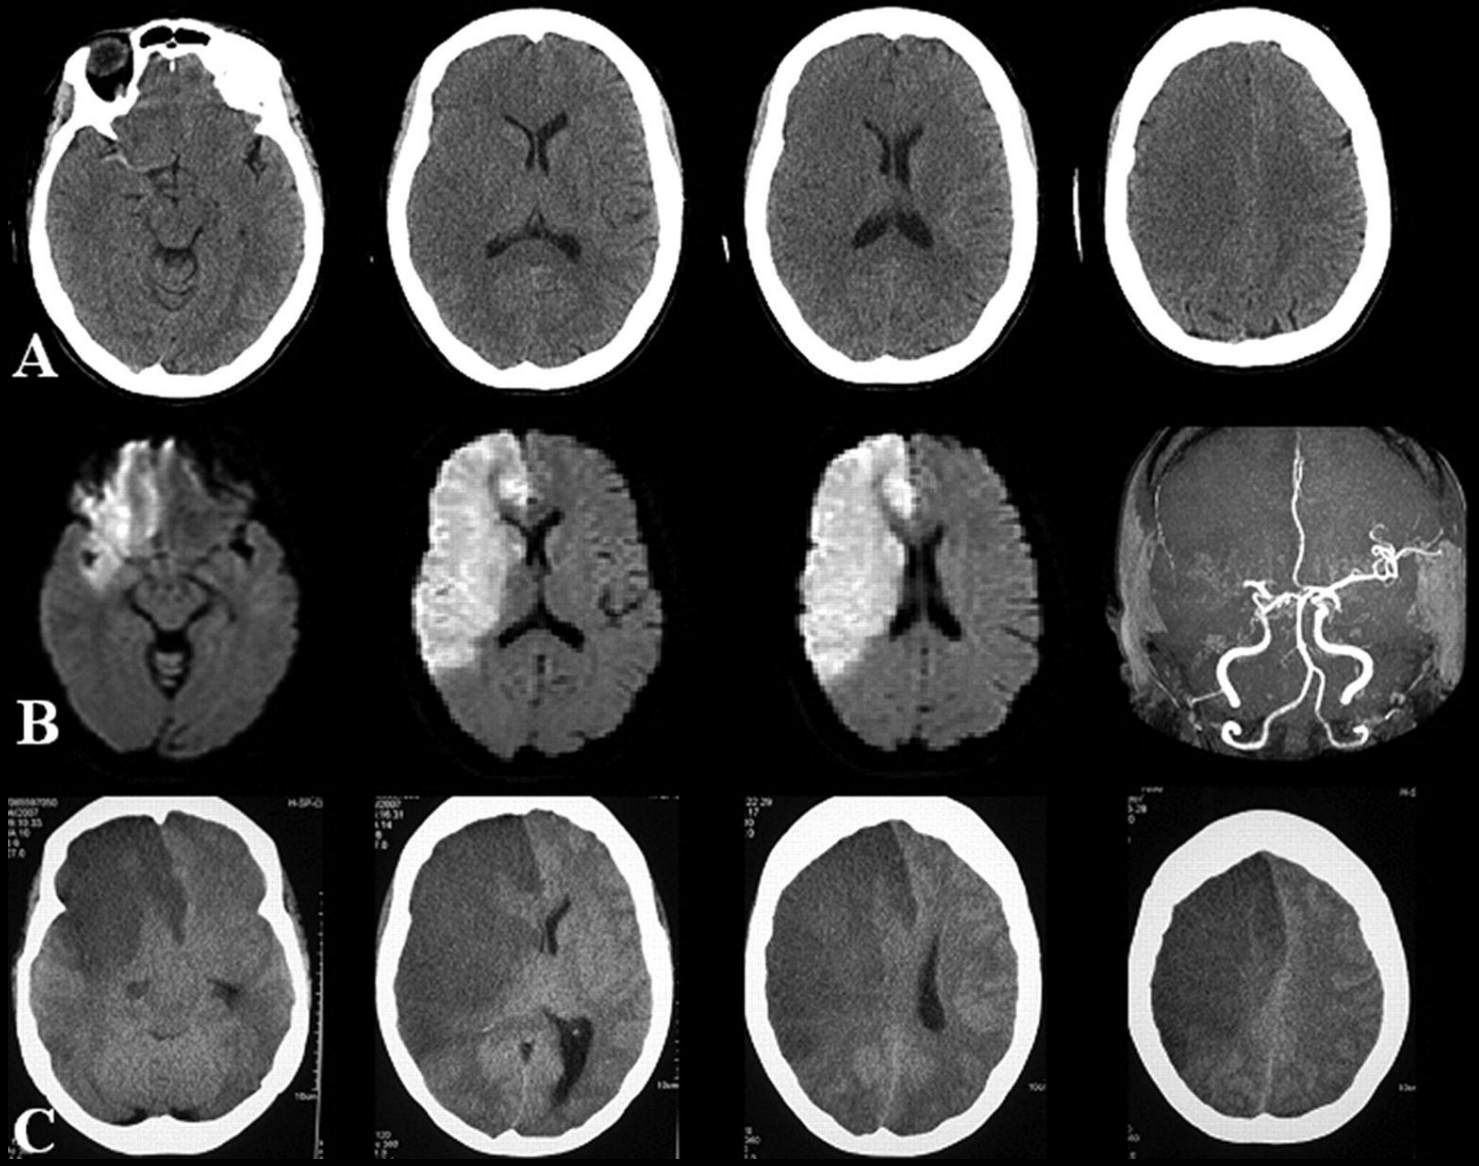
- Introduce clinical dilemma of antithrombotic therapy following ICH in patients with AF.
- Review current evidence and clinical guidelines
- Discuss ongoing randomized controlled trials

Background

- Atrial fibrillation (AF) currently afflicts an estimated 3% of Canadians.

- Primary source of cardioembolic stroke.

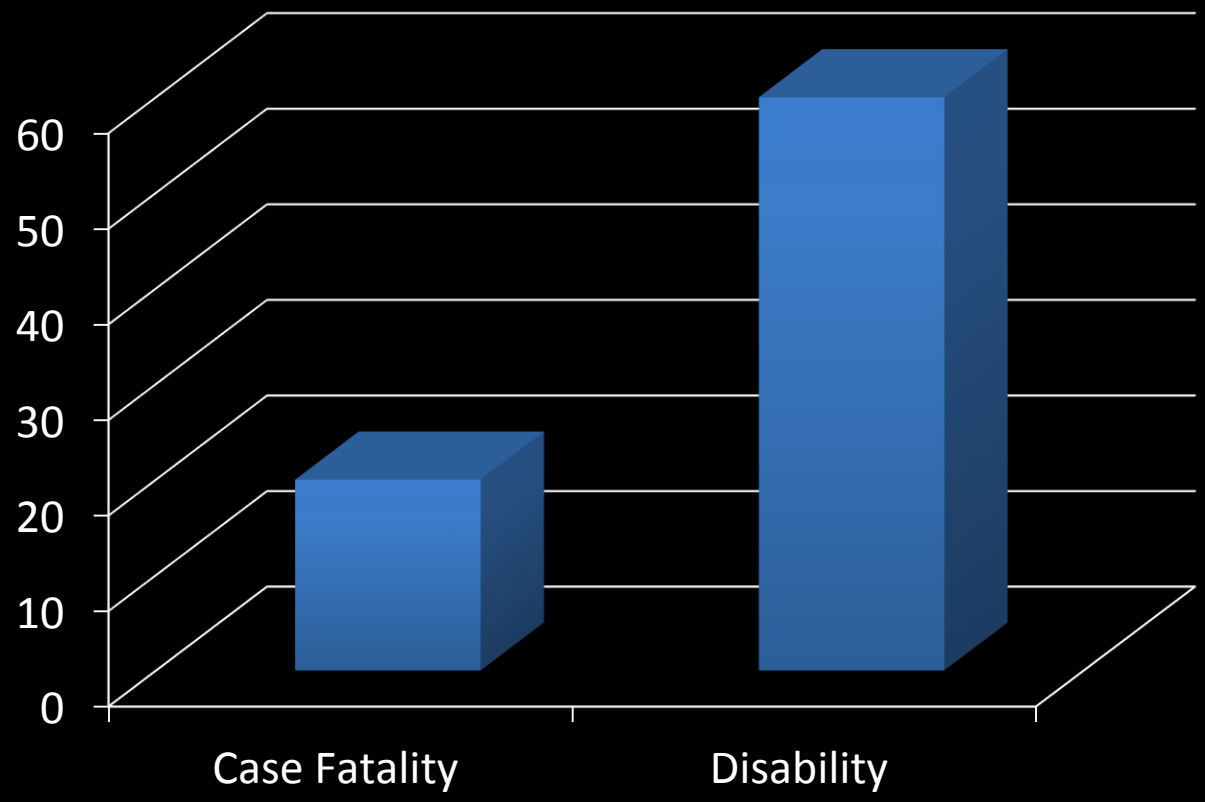




Highest rate of death and long-term disability amongst ischemic stroke subtypes

Stroke Outcomes

Effect of first ischemic stroke in patients with AF (n=597)



AF=atrial fibrillation

Gladstone DJ et al. *Stroke* 2009; 40:235-240

Oral Anticoagulant Therapy Prescription in Patients With Atrial Fibrillation Across the Spectrum of Stroke Risk

Insights From the NCDR PINNACLE Registry FREE

Jonathan C. Hsu, MD, MAS[1]; Thomas M. Maddox, MD, MSc[2,3,4]; Kevin F. Kennedy, MS[5]; David F. Katz, MD[3]; Lucas N. Marzec, MD[3]; Steven A. Lubitz, MD, MPH[6]; Anil K. Gehi, MD[7]; Mintu P. Turakhia, MD, MAS[8,9]; Gregory M. Marcus, MD, MAS[10]

- Cross-sectional registry of outpatients with AF enrolled in the American College of Cardiology National Cardiovascular Data PINNACLE (2008-2012) Registry ~ 430 000 AF patients
- Only 45% received anticoagulation
  - 90.3% Warfarinth
- 26% ASA

- $CHADS_2 \geq 3$ 50% prescribed anticoagulation

JAMA Cardiol. 2016;1(1):55-62. doi:10.1001/jamacardio.2015.0374.

Anticoagulant-Related Intracerebral Hemorrhage

Factors Influencing Physicians' Reported Use of Anticoagulation Therapy in Nonvalvular Atrial Fibrillation: A Cross-Sectional Survey

Cary P. Gross, MD,[1] Eric W. Vogel, MD,[2] Abhay J. Dhond, MD,[1] Cheryl B. Marple, MS, MPH,[3] Roger A. Edwards, ScD,[4*] Ole Hauch, MD,[3] Elizabeth A. Demers, MD,[2] and Michael Ezekowitz, MD[2]

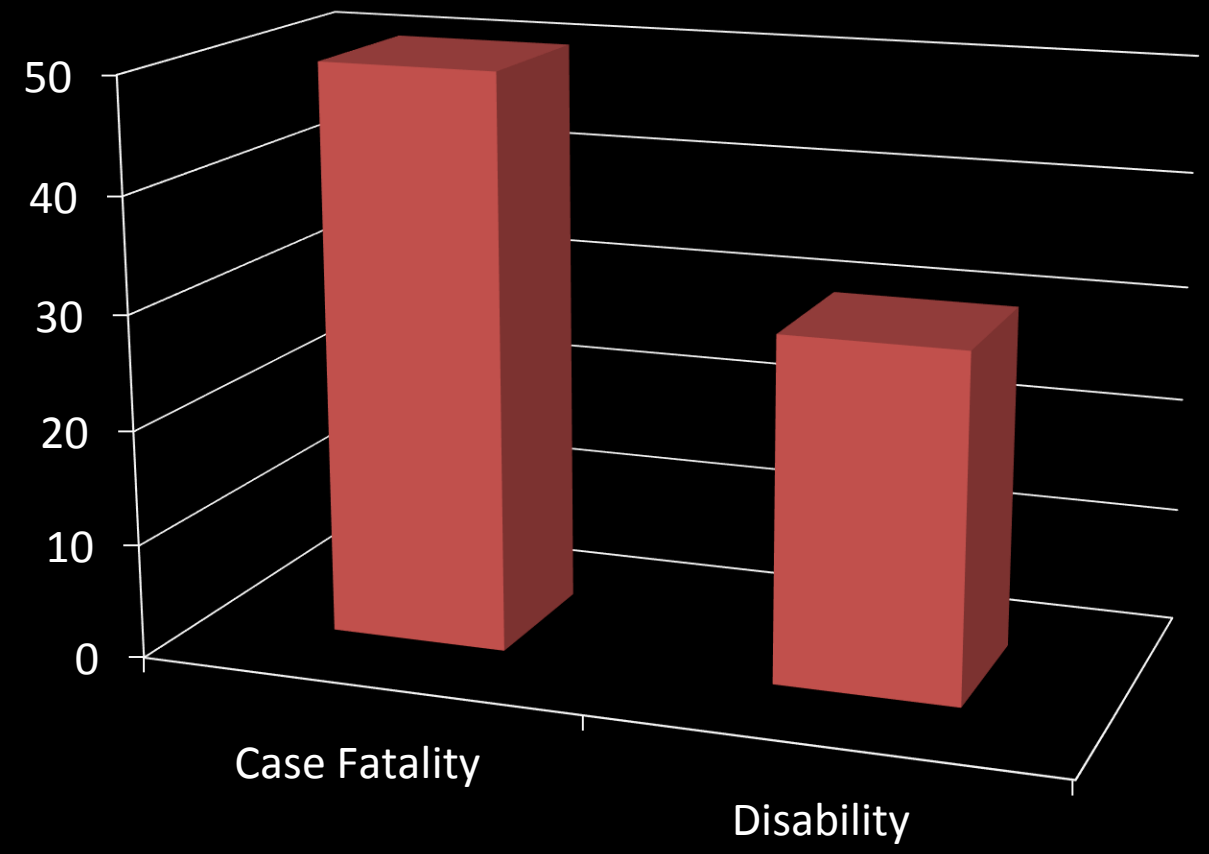
- Physician survey (case vignettes)
- 142 responses from general internists
- Estimates of annual rate of anticoagulant-associated intracerebral hemorrhage were 10-fold higher than literature-based estimates.
- Decision on whether to treat driven not by perceived benefit in a particular case, but rather concern for harm

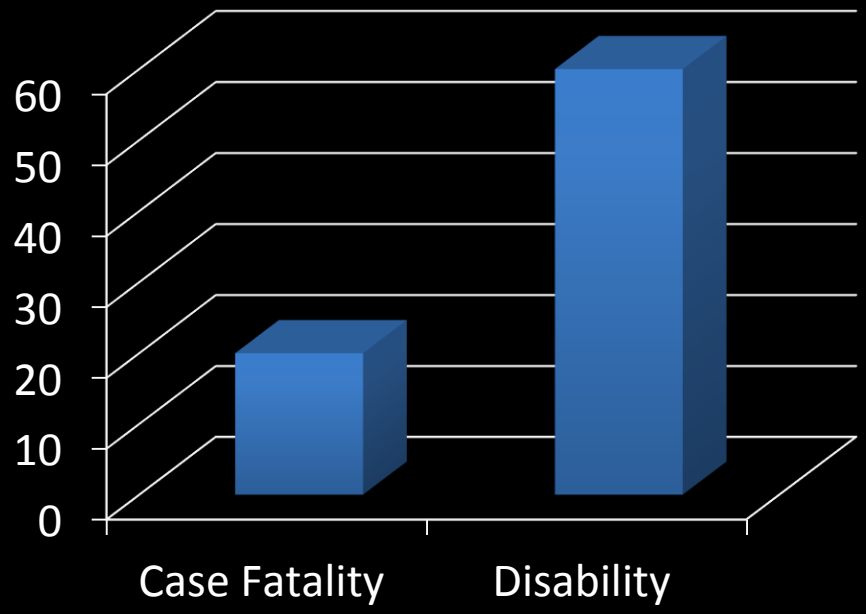
CLINICAL THERAPEUTICS® / VOL. 25, NO. 6, 2003

Incidence, case fatality, and functional outcome of intracerebral haemorrhage over time, according to age, sex, and ethnic origin: a systematic review and meta-analysis

Charlotte J van Asch, Merel JA Luitse, Gabriël JE Rinkel, Ingeborg van der Tweel, Ale Algra, Catharina JM Klijn

Lancet Neurol 2010; 9: 167–76



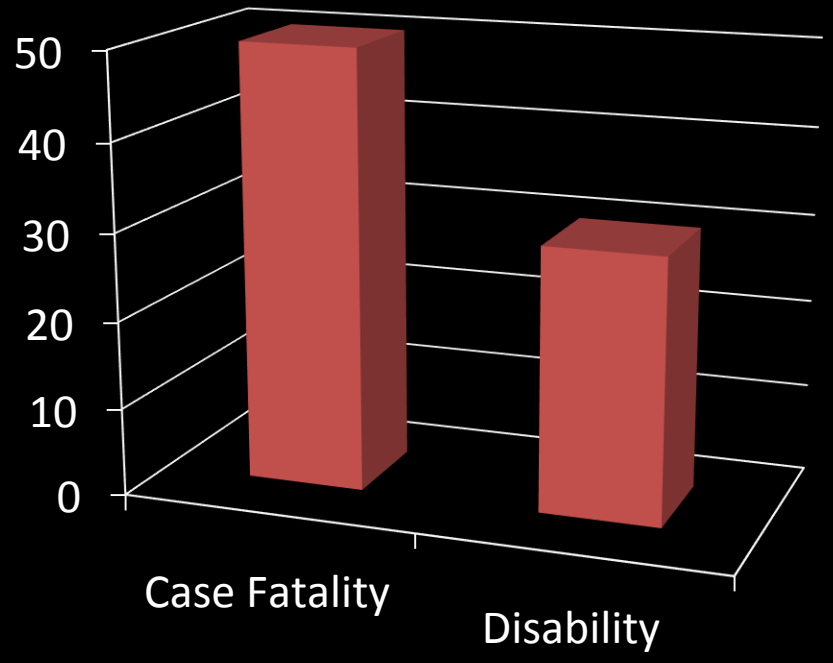


AF-related Ischemic Stroke

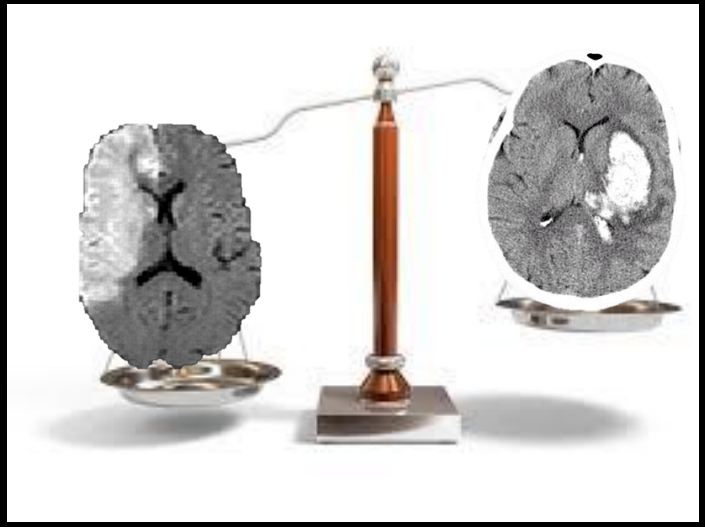
80% death and long-term disability.

Anticoagulant-related ICH

80% death and long-term disability.



- Anticoagulating AF patients after intracerebral hemorrhage poses a challenging clinical dilemma that requires balancing the benefit of reducing thromboembolism against the potential increased risk of recurrent intracerebral hemorrhage.



Guidelines

AHA 2015 (Management Spont. ICH)	**Avoid anticoagulation <u>WITH WARFARIN.</u>** **Anticoagulation after nonlobar ICH and antiplatelet monotherapy after any ICH can be considered particularly where there exists a strong indication** **The usefulness of <u>NOACs</u> in patients with AF and prior ICH uncertain.**
ESO 2014	**In the absence of RCTs to address these treatment dilemmas, we cannot make firm recommendations about whether and when to resume antithrombotic drugs after ICH.**
Canadian Stroke Best Practice Recommendations 2015	**If there is a persisting strong indication for anticoagulation (e.g. atrial fibrillation, mechanical heart valve), the decision about when to restart anticoagulant therapy should be made on a case-by-case basis**

What to do?

- Significant clinical equipoise and variability in practice
  - 2008 Japanese physician survey: 91% of respondents resumed anticoagulation (76% with warfarin).
  - Center dependent in Europe with antithrombotic resumption rate ranging from 11-45%.

Maeda K, et al. *J Neurol Sci*. 2012;312:82-85

Can Patients Be Anticoagulated After Intracerebral Hemorrhage?: A Decision Analysis

Mark H. Eckman, Jonathan Rosand, Katherine A. Knudsen, Daniel E. Singer and Steven M. Greenberg

- Markov decision analysis assessing quality-adjusted life years among patients receiving either no antithrombotic therapy, aspirin or warfarin after intracerebral hemorrhage in patients with AF

- Suggestion: aspirin is likely the preferred treatment in most cases, on the basis of lower recurrent intracerebral hemorrhage rates, despite a much lower efficacy for ischemic stroke prevention.
  - Deep ICH: Consider restarting anticoagulation
  - Lobar ICH: No antithrombotic therapy or ASA

(*Stroke*. 2003;34:1710-1716.)

Can Patients Be Anticoagulated After Intracerebral Hemorrhage?: A Decision Analysis
Mark H. Eckman, Jonathan Rosand, Katherine A. Knudsen, Daniel E. Singer and Steven M. Greenberg

- Limitations:
  - Direct oral anticoagulants not factored into analysis
    - Not available at the time
  - Estimated 2-fold increased rate of ICH with wafarin
    - May not be the case.

(*Stroke*. 2003;34:1710-1716.)

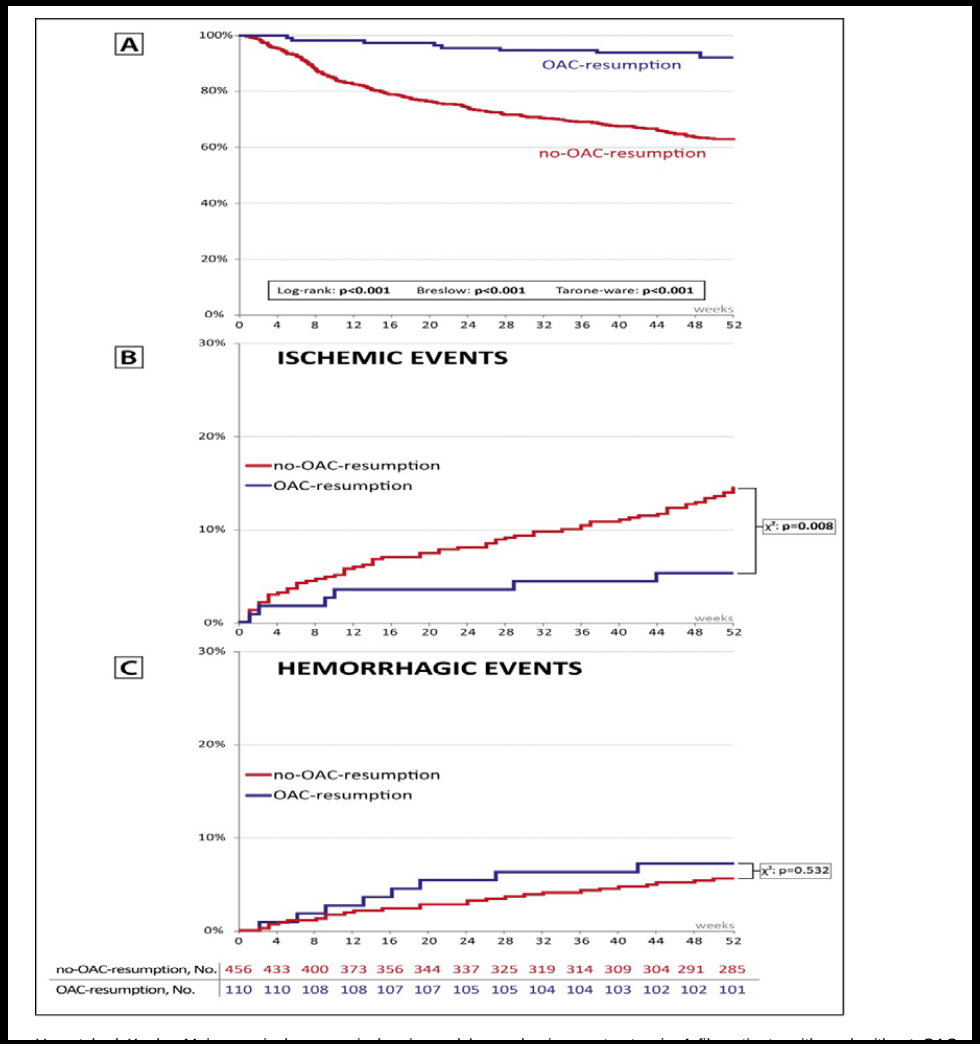
Real-World Data: Recurrent ICH

Anticoagulant Reversal, Blood Pressure Levels, and Anticoagulant Resumption in Patients With Anticoagulation-Related Intracerebral Hemorrhage



110 of 556 (20%) patients with AF and ICH restarted on anticoagulation

19 centers, 2006-2010

Anticoagulant Reversal, Blood Pressure Levels, and Anticoagulant Resumption in Patients With Anticoagulation-Related Intracerebral Hemorrhage

eTable 9. Propensity-matched Cox regression analyses of long-term mortality in A-fib patients.

Patients with atrial fibrillation (n=261)	No. of patients	No. of events (%)	Hazard ratio (95%CI)	*P* Value	Adjusted Hazard ratio 95%CI)	*P* Value
Overall	261	56 (21.5%)				
OAC resumption	108	9 (8.3%)	0.233 (0.114-0.476)	**<0.001**	0.258 (0.125-0.534)	**<0.001**
No OAC resumption	153	47 (30.7%)	1 (reference)		1 (reference)	

Cox regression analysis included all OAC-ICH patients with A-fib after propensity matching. Hazard ratio model was adjusted for events (new ischemic, recurrent hemorrhagic) during 1 year of follow-up and by propensity score (age, ICH volume, IVH, hematoma growth, NIHSS, $CHADS_2$ score as well as pre- and discharge-mRS). Assumption of proportionality was tested by locally weighted scatterplot smoothing of partial Schoenfeld residuals and PH testing. All covariates met the assumption. Significant parameters are expressed in bold.

74% RR in long-term mortality

Anticoagulant Reversal, Blood Pressure Levels, and Anticoagulant Resumption in Patients With Anticoagulation-Related Intracerebral Hemorrhage

eTable 8. Propensity-matched analysis of event and incidence rates in A-fib patients – new ischemic stroke *versus* recurrent ICH.

Patients with atrial fibrillation	No. of Patients	No. of events (%)	*P* Value	Incidence rate per 100 patient years (95%CI)	*P* Value
New cerebral Infarction	261	20 (7.7%)		8.7 (3.8-12.6)	
According to treatment					
OAC resumption	108	4 (3.7%)	**0.04**	3.9 (1.9-5.8)	**0.02**
No OAC resumption	153	16 (10.5%)		12.7 (6.5-19.1)	
Recurrent ICH	261	9 (3.4%)		3.9 (1.4-6.5)	
According to treatment					
OAC resumption	108	4 (3.7%)	0.55	3.9 (1.9-5.8)	0.92
No OAC resumption	153	5 (3.3%)		3.9 (2.2-5.7)	

Analysis included all OAC-ICH patients with A-fib after propensity matching. Given are: total number of patients for analysis, raw number of events and incidence rates (per 100 patient-years) calculated for time on each specific treatment (OAC *versus* no-OAC as defined) during 1 year of follow-up. Significant parameters are expressed in bold.

65% RR new cerebral infarcts

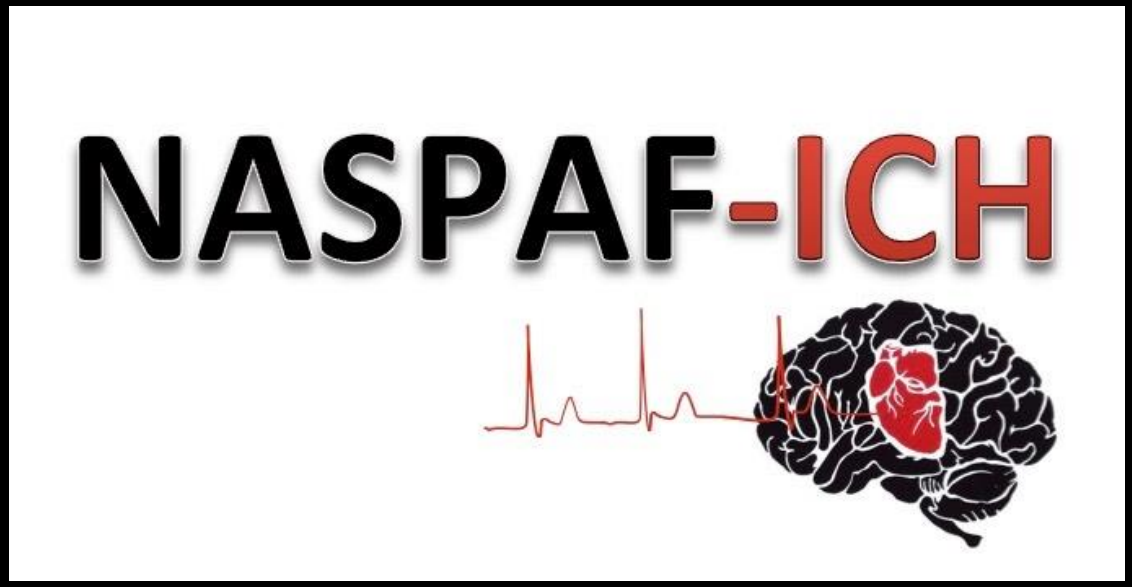
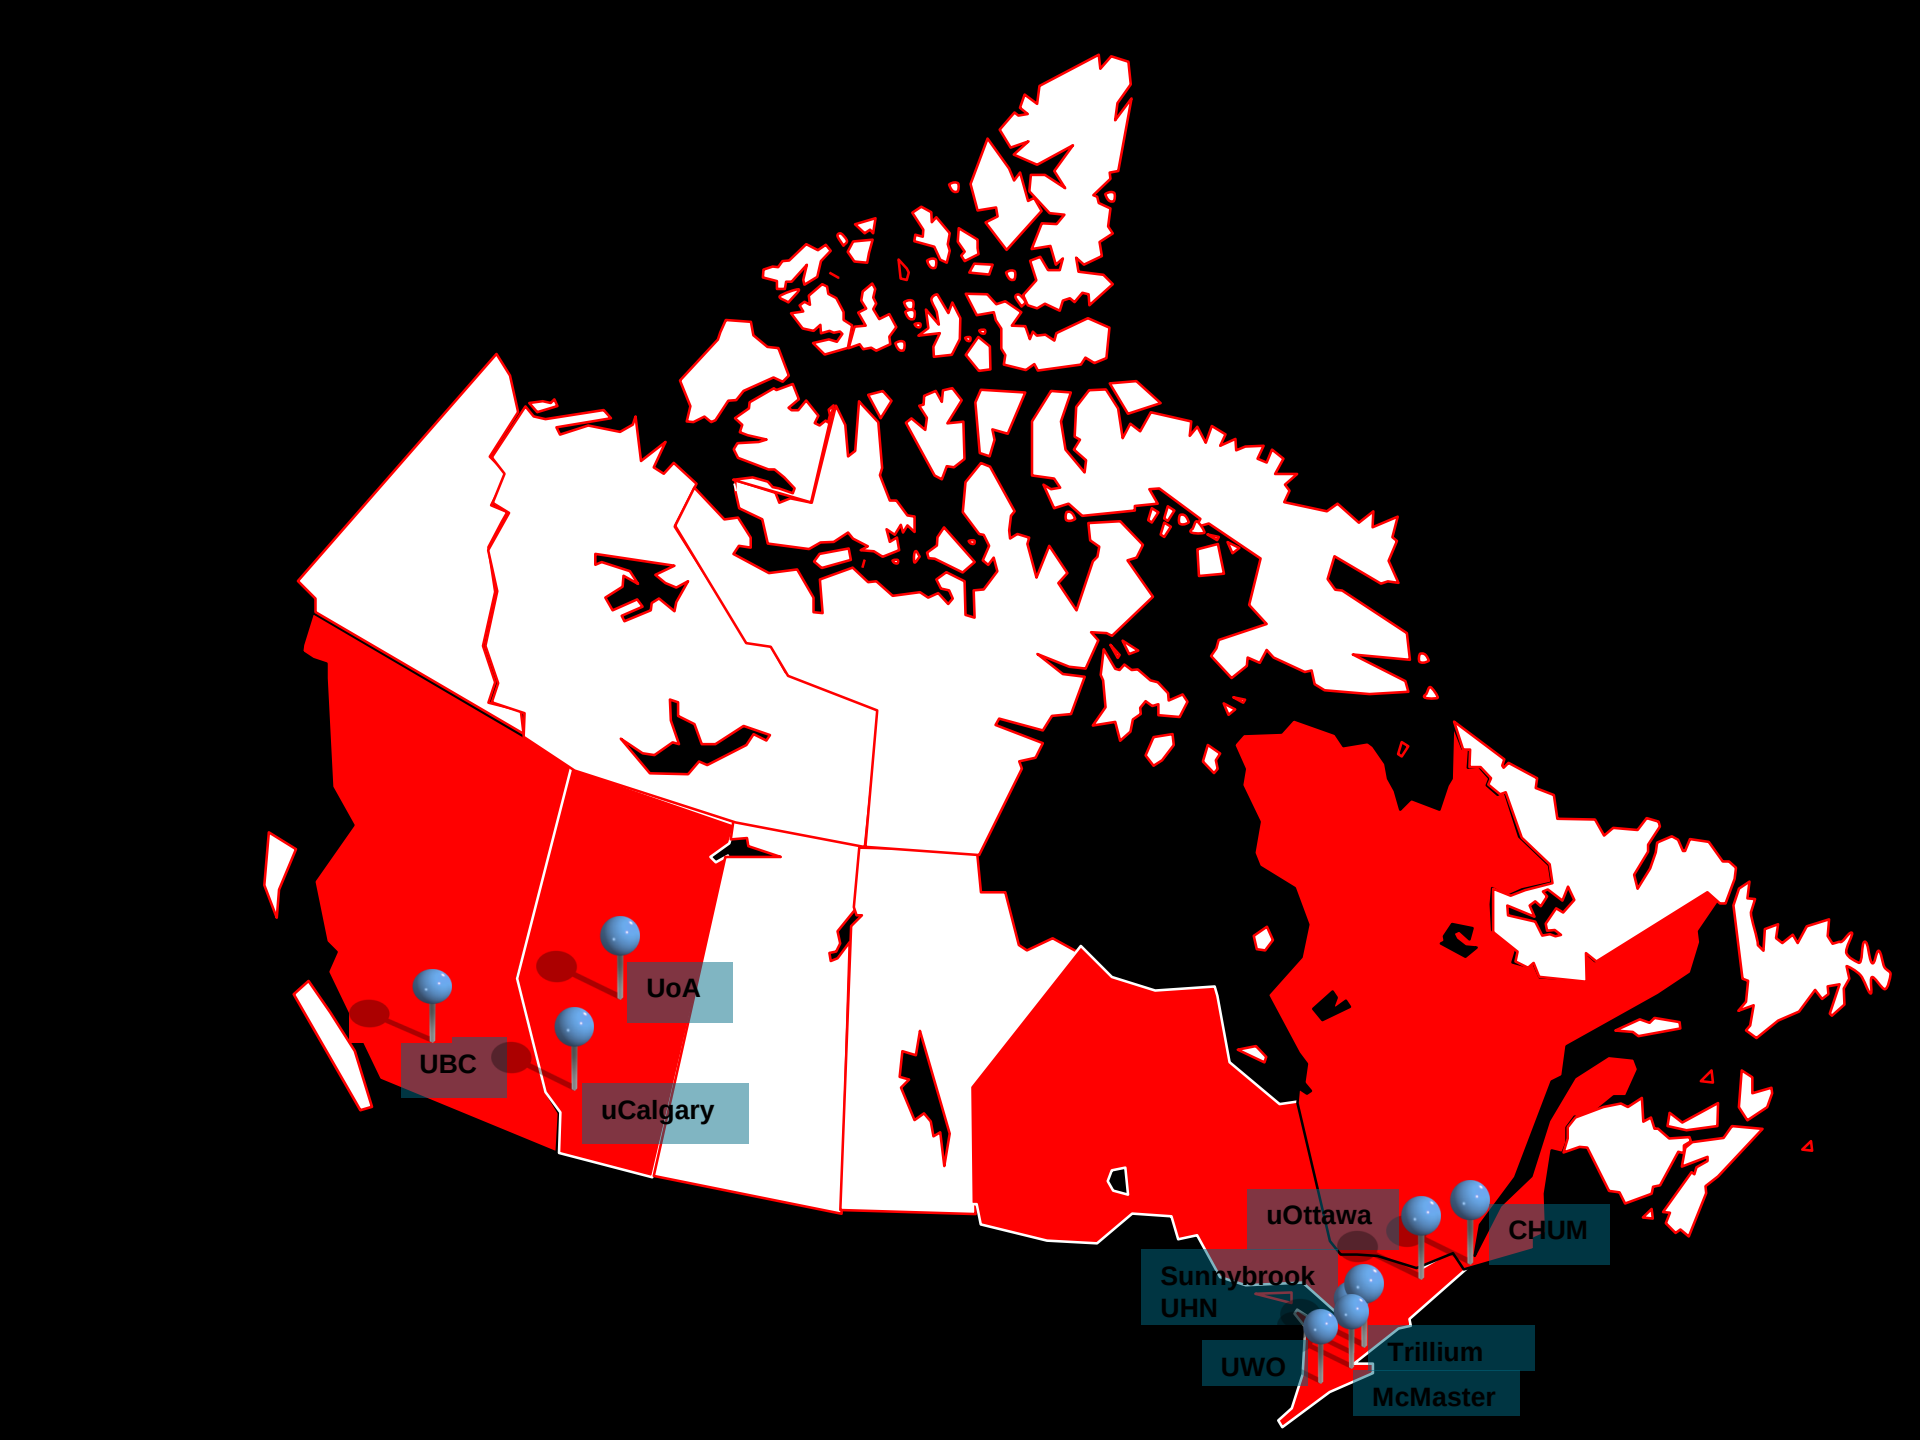
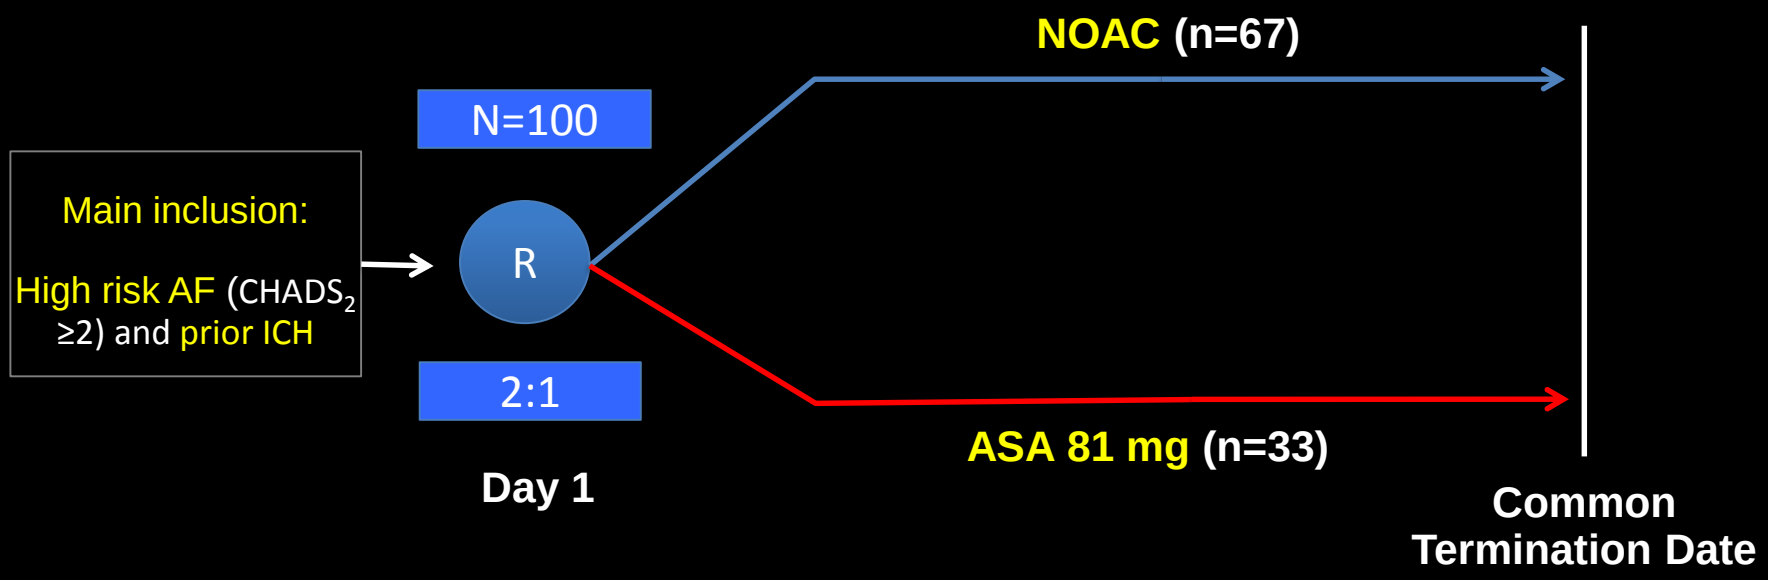
Non-vitamin K Antagonist Anticoagulant for Stroke Prevention in patients with Atrial Fibrillation and ICH





UoA
UBC
uCalgary
uOttawa
CHUM
Sunnybrook
UHN
Trillium
UWO
McMaster

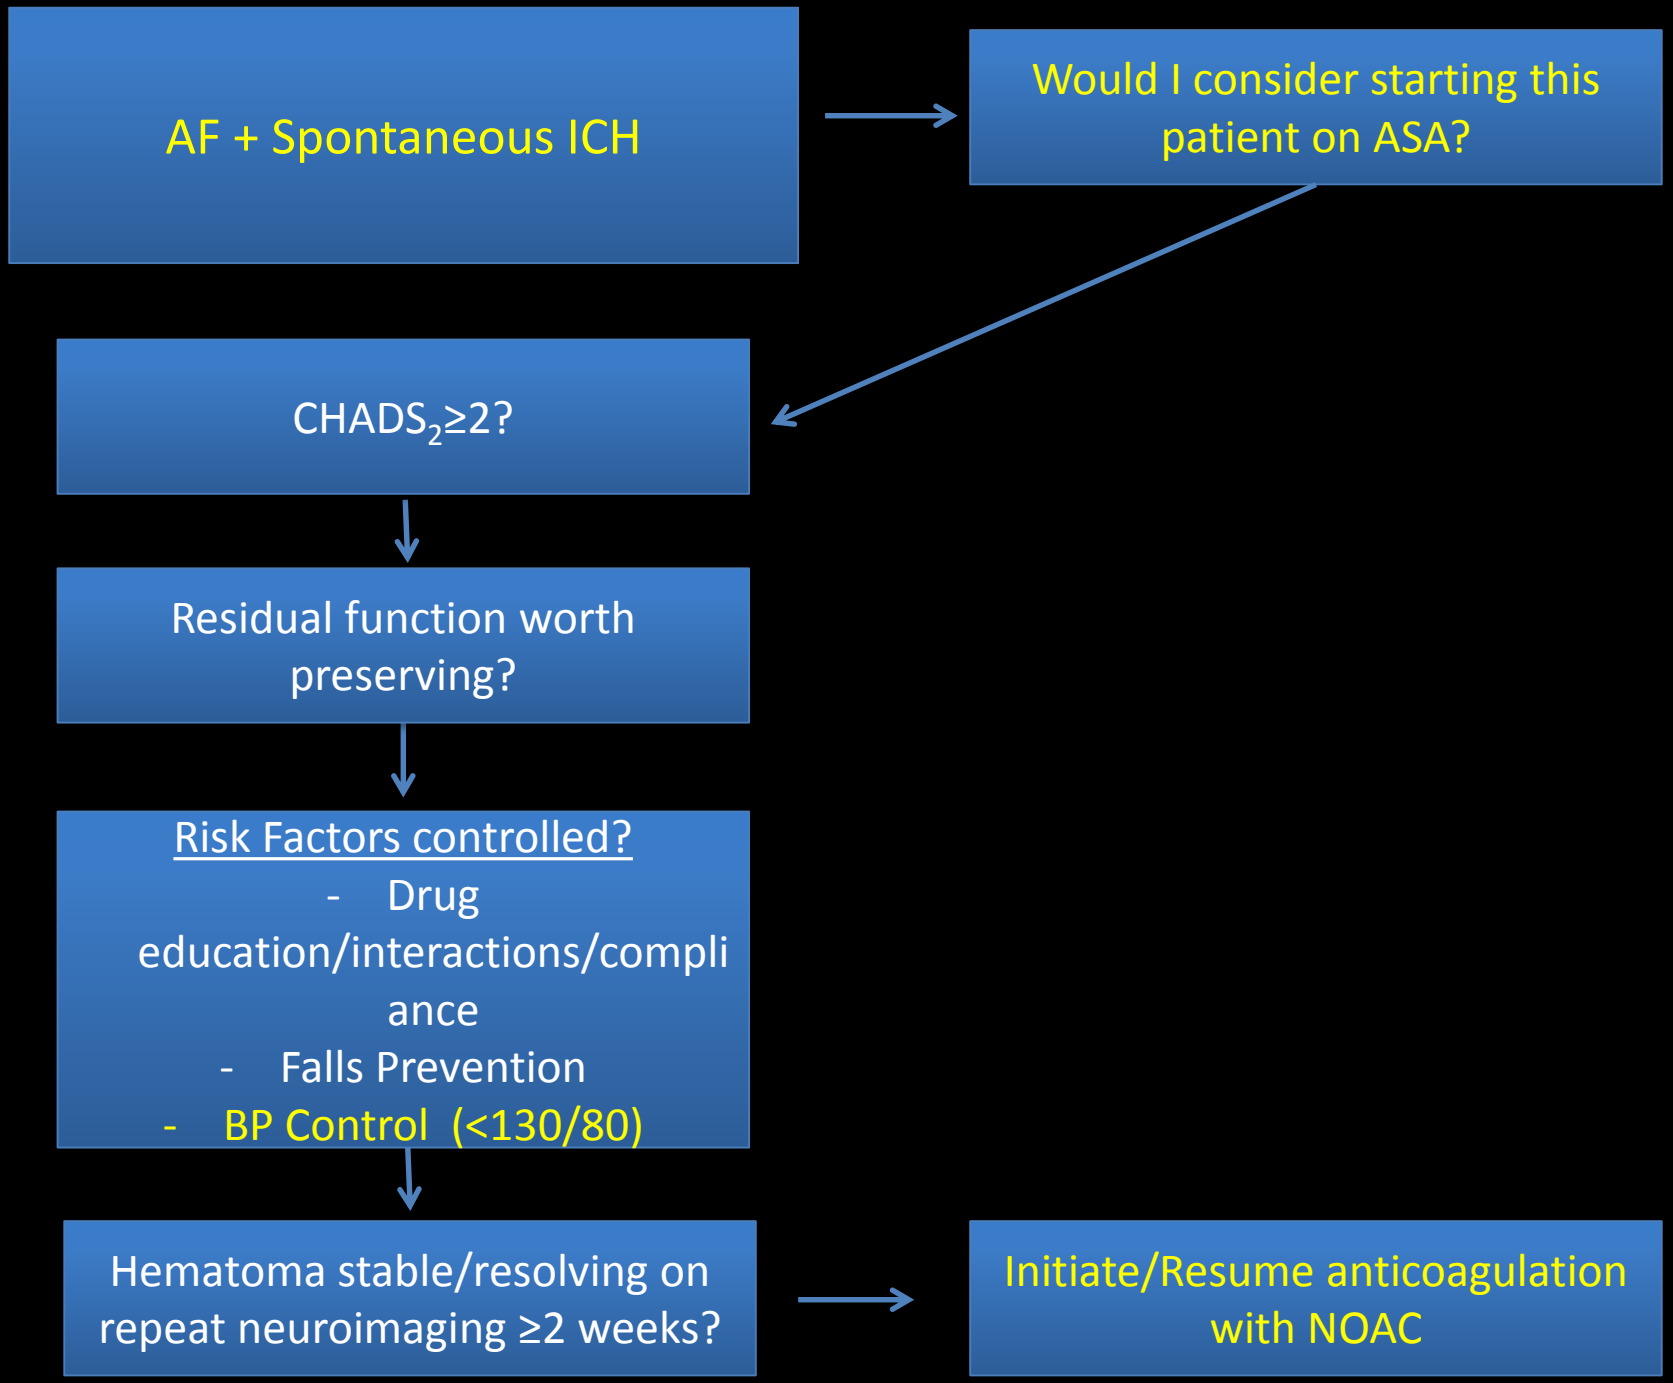


Recruitment period: 24 months
Last participant followed: 6 months

Total study duration: ~ 3 years
Mean follow-up per participant: 12 months (range 6 - 30 months)
Primary outcome: Composite of ischemic stroke and recurrent ICH

Special procedure: MRI at study entry for post-hoc risk stratification according to burden of CSVD.

	APACHE-AF	NASPAF-ICH	SoSTART	ASPIRE
Country	Netherlands	Canada	UK	USA
Participants	n=100, AF and CHA2DS2 VASc≥ 3, 7-90 days after OAC-associated ICH/IVH	n=100, AF and CHADS2≥2, ≥ 14 days after ICH/IVH	n=60, AF and CHA2DS2 VASc ≥ 2, >24 hours after intracranial haemorrhage	n=370, Non-CAA CHA2DS2 VASc ≥ 2
Intervention	Apixaban	Any NOAC	NOAC (any) or VKA	Apixaban
Comparator	Antiplatelet or no antithrombotic drug	Aspirin	Antiplatelet or no antithrombotic drug	Aspirin
Allocation	1:1	2:1	1:1	1:1
Masking	Adjudication only	Adjudication only	Adjudication only	Double blind
1° outcome/fu	Vascular death or non-fatal stroke/ ≥ 12 months	Recruitment rate, Composite of ICH and IS / ≥ 6 months	All symptomatic serious vascular events/ ≥ 12 months	Recurrent stroke and all-cause mortality



AF + Spontaneous ICH
Would I consider starting this patient on ASA?
CHADS2≥2?
Residual function worth preserving?
Risk Factors controlled?
- Drug education/interactions/compliance
- Falls Prevention
- BP Control (<130/80)
Hematoma stable/resolving on repeat neuroimaging ≥2 weeks?
Initiate/Resume anticoagulation with NOAC
