TAKING THE BM OUT OF EMB: AN EVIDENCE YEAR IN REVIEW

MEDS 2019

- BS is very fast
- Why is BS fast? → It was pushed.
- What answer would you like?
- BS is an excellent organic fertilizer
- ASA is primarily done
- That fish won't die
- Take a CHANCE on clopidogrel
- You can't handle the truth
- Antidepressants: Handle with care

- The reality of Pharmacogen-OH-mics
- Funny thing happened on the way to the post-marketing study
- Classy Diabetes Drugs?
- Amazing New Diabetes Drug
- Or Dog it
- K whY is this so simple?
- What!? Those water bottle people have it right!

HOUSTON, WE HAVE A PROBLEM?

THE UPHILL ROAD TO **SANE** PUBLIC HEALTH BEHAVIOUR?

Weaponized Health Communication: Twitter Bots and Russian Trolls Amplify the Vaccine Debate

David A. Broniatowski, PhD, Amelia M. Jamison, MAA, MPH, SiHua Qi, SM, Lulwah AlKulaib, SM, Tao Chen, PhD, Adrian Benton, MS, Sandra C. Quinn, PhD, and Mark Dredze, PhD

Am J Public Health. 2018;108:1378–1384.

DEFINING TERMS

- "Bots" accounts that automate content promotion
- "Trolls" Individuals who misrepresent their identities with intention of promoting discord
- Russian trolls and bots post content about vaccination at a higher rate than the average user
- Strategy to promote discord across a range of controversial topics

- Amplification online disinformation strategy creates false impression of equivalence
 - Generate several tweets on the same topic with intention of flooding the discourse

THE UPHILL ROAD TO **SANE** PUBLIC HEALTH BEHAVIOUR?

EXAMPLES OF TWEETS WITH #VACCINATEUS AND CORRESPONDING THEMES: JULY 14, 2014–SEPTEMBER 26, 2017

Antivaccine theme	Example tweet		
Freedom of choice/antimandatory vaccines	VaccinateUS mandatory #vaccines infringe on constitutionally protected religious freedoms		
Can't trust government on vaccines	Did you know there was a secret government database of #vaccine-damaged children? #VaccinateUS		
Pharmaceutical companies want vaccine profits	Pharmacy companies want to develop #vaccines to cash, not to prevent deaths #VaccinateUS		
Vaccines cause bad side effects	#VaccinateUS #vaccines can cause serious and sometimes fatal side effects		
Natural immunity is better	#VaccinateUS natural infection almost always causes better immunity than #vaccines		
General vaccine conspiracy theories	Dont get #vaccines. Iluminati are behind it. #VaccinateUS		
Vaccines cause autism	Did you know #vaccines caused autism? #VaccinateUS		
Vaccine ingredients are dangerous	#VaccinateUS #vaccines contain mercury! Deadly poison!		
Diseases aren't so dangerous	#VaccinateUS most diseases that #vaccines target are relatively harmless in many cases, thus making #vaccines unnecessary		

Provaccine theme	Example tweet		
Vaccines work	#VaccinateUS #vaccines save 2.5 million children from preventable diseases every year		
Vaccines should be mandatory	Your kids are not your property! You have to #vaccinate them to protect them and all the others! #VaccinateUS		
People who don't vaccinate are stupid	#VaccinateUS You can't fix stupidity. Let them die from measles, and I'm for #vaccination!		
Vaccination protects herd immunity	#VaccinateUS #vaccines protect community immunity		
People who don't vaccinate put me/my kids at risk	#VaccinateUS My freedom ends where another person's begins. Then children should be #vaccinated if disease is dangerous for OTHER children		
Vaccines don't cause autism	#vaccines cause autism—Bye, you are not my friend anymore. And try to think with your brain next #VaccinateUS		
You deserve bad things if you don't vaccinate	<pre>#vaccines are a parent's choice. Choice of a color of a little coffin #VaccinateUS</pre>		
Alternative medicine doesn't work	Do you still treat your kids with leaves? No? And why don't you #vaccinate them? Its medicine! #VaccinateUS		
People died without vaccines	Most parents in Victorian times lost children regularly to preventable illnesses. #vaccines can solve this problem #VaccinateUS		

WHY?

- Content Polluters unsolicited commercial content use post antivaccine messages more than the average twitter users
- True antivaccine sentiment? or tactic just designed to drive up click-though rates.
- Significant proportion of antivaccine messages are organized "astroturf" – not grassroots
- Astroturf Astroturfing is the artificial creation of a grassroots buzz for a product, service or political viewpoint. ... Astroturf marketing has a negative connotation, primarily because disreputable marketers have used deceptive tactics to build their buzz by taking advantage of the anonymity the Internet provides.

WHY DO WE CARE?

Corrigendum: Many Analysts, One Data Set: Making Transparent How Variations in Analytic Choices Affect Results

67 Analysts:

- given identical data
- research question: Soccer referees → more likely to give red cards to dark- skin toned players than light-skin toned players

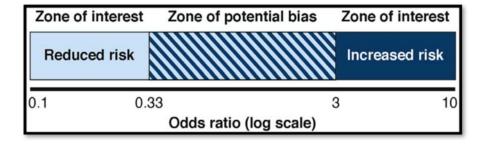

RESULTS:

- 69% of teams found a statistically significant positive effect
- 31% did not observe a statistically significant relationship
- OR ranged from 0.89 to 2.93

ONE DATA SET, MANY ANALYSTS 78.7* Twenty-nine research teams reached a wide variety of conclusions ... 11.5* using different methods on the same data set to answer the same question (about football players' skin colour and red cards). Dark-skinned players four times more likely than Statistically significant light-skinned effect players to be given Non-significant a red card. effect Twice as likely Equally likely Point estimates and 95% confidence intervals. *Truncated upper bounds.

WHY DO WE CARE?

WHY WE DON'T CARE?

JAMA Internal Medicine | Original Investigation

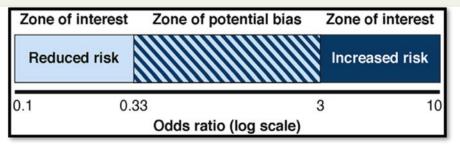

Association of Frequency of Organic Food Consumption With Cancer Risk

Findings From the NutriNet-Santé Prospective Cohort Study

Julia Baudry, PhD; Karen E. Assmann, PhD; Mathilde Touvier, PhD; Benjamin Allès, PhD; Louise Seconda, MSc; Paule Latino-Martel, PhD; Khaled Ezzedine, MD, PhD; Pilar Galan, MD, PhD; Serge Hercberg, MD, PhD; Denis Lairon, PhD; Emmanuelle Kesse-Guyot, PhD

JAMA Intern Med 2018;178(12):1597-1606

RESULTS Among 68 946 participants (78.0% female; mean [SD] age at baseline, 44.2 [14.5] years), 1340 first incident cancer cases were identified during follow-up, with the most prevalent being 459 breast cancers, 180 prostate cancers, 135 skin cancers, 99 colorectal cancers, 47 non-Hodgkin lymphomas, and 15 other lymphomas. High organic food scores were inversely associated with the overall risk of cancer (hazard ratio for quartile 4 vs quartile 1, 0.75; 95% CI, 0.63-0.88; *P* for trend = .001; absolute risk reduction, 0.6%; hazard ratio for a 5-point increase, 0.92; 95% CI, 0.88-0.96).

CANTHE CAM?

JAMA Oncology | Original Investigation

Complementary Medicine, Refusal of Conventional Cancer Therapy, and Survival Among Patients With Curable Cancers

Skyler B. Johnson, MD; Henry S. Park, MD, MPH; Cary P. Gross, MD; James B. Yu, MD, MHS

JAMA Oncol. doi:10.1001/jamaoncol.2018.2487 Published online July 19, 2018.

CANTHE CAM?

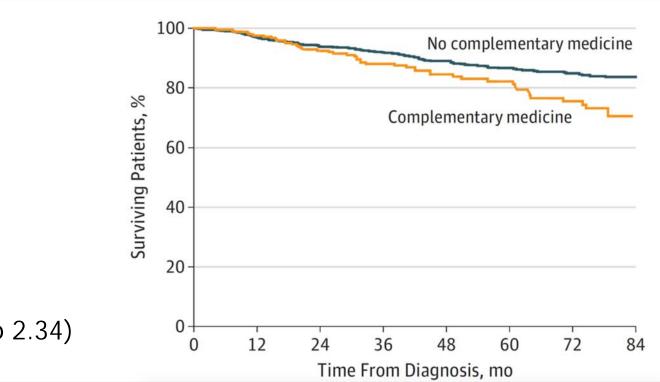

More Likely to Use CAM:

- Younger
- Female
- Higher Socio-economic status
- Higher Education
- → Poorer 5-year survival

82.2% vs. 86.6%

(p = 0.001, HR 1.70 95% CI 1.24 to 2.34)

Figure. Survival of Patients Who Used Complementary Medicine vs Those Who Used No Complementary Medicine for Breast, Prostate, Lung, and Colorectal Cancer

TIME WASTE?

If I don't think this was a good year for aspirin in primary prevention.

- Medscape, Dec 2018

ITHOUGHT WE ALREADY KNEW THE ANSWER TO THIS...

ARRIVE (Lancet 2018; 392: 1036-46) $\rightarrow n=12,546 \times 5 \text{ yrs}$

Use of aspirin to reduce risk of initial vascular events in patients at moderate risk of cardiovascular disease (ARRIVE): a randomised, double-blind, placebo-controlled trial

ASCEND (N Engl J Med 2018;379:1529-39) \rightarrow n=15,480 X 7.4 yrs

Effects of Aspirin for Primary Prevention in Persons with Diabetes Mellitus

ASA 100mg vs. placebo

ASPREE (N Engl J Med 2018;379:1499-1528) \rightarrow n=19,114 X 4.7 yrs

Effect of Aspirin on All-Cause Mortality in the Healthy Elderly

Effect of Aspirin on Cardiovascular Events and Bleeding in the Healthy Elderly

ASA'S LACK OF NET BENEFIT IN 1 SLIDE

(for primary prevention, of course)

ARRIVE (Lancet 2018; 392: 1036–46) → n=12,546 (moderate CV risk)

CV events: **↓**0.19% (NS)

Moderate bleeding: 10.16% (NS)

ASCEND (N Engl J Med 2018;379:1529-39) → n=15,480 (DM2)

CV events: **↓**1.1%

Major bleeding: 10.9%

ASPREE (N Engl J Med 2018;379:1499-1528) → n=19,114 (mean age = 74)

CV events: **↓**0.24% (NS)

Death: **1**0.7%

Major bleeding: 1.0%

Now, let us never speak of this again

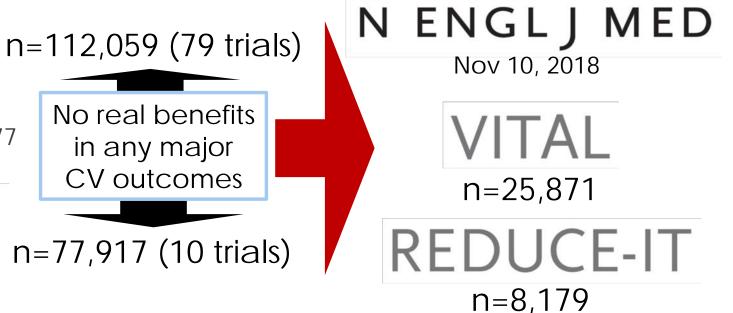

IS SOMETHING FISHY GOING ON HERE?

WHAT WAS REDUCED?

→ What's inside the gift basket?

SECONDARY: ARR = 3.6% (NNT=28)

TA	KE	HO	ME?
		П	

- Does it need repeating? →
 probably? → STRENGTH trial
 (n=13,000 → 4g of EPA+DHA)
- Is the net benefit big enough to give to all CAD patients on statins (when it gets to)?

Cardiovascular Death		ARR = 0.9%	174/4089 (4.3%)	213/4090 (5.2%)	0.80 (0.66–0.98)
Nonfatal Myocardial Infarction		ARR = 2.3%	237/4089 (5.8%)	332/4090 (8.1%)	0.70 (0.59–0.82)
Nonfatal Stroke	-	ARR = 0.8%	85/4089 (2.1%)	118/4090 (2.9%)	0.71 (0.54–0.94)

But... silent MI were included, but frequency not reported (i.e. the most abundant gift is of questionable quality)

WHAT WAS INCREASED? → New atrial fibrillation (ARI = 1.4%)

IF WE CAN'T PREVENT THE IST, MAYBE WE CAN PREVENT THE 2ND...

DAPT POST-STROKE?

AHA Stroke CPG 2018:

5. In patients presenting with minor stroke, treatment for 21 days with dual antiplatelet therapy (aspirin and clopidogrel) begun within 24 hours can be beneficial for early secondary stroke prevention for a period of up to 90 days from symptom onset.

CHANCE study

"The generalizability of this intervention in non-Asian populations remains to be established, and a large phase III multicenter trial in the US, Canada, Europe, and Australia is ongoing"

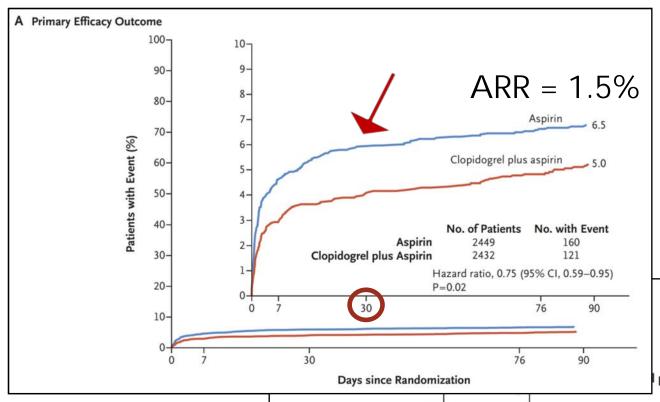

the **POINT** trial... N Engl J Med 2018;379:215-25

Clopidogrel and Aspirin in Acute Ischemic Stroke and High-Risk TIA

lla

- n=4881 (83% in North America), minor ischemic stroke or high-risk TIA
 - → ASA + clopidogrel vs. ASA alone X 90 days

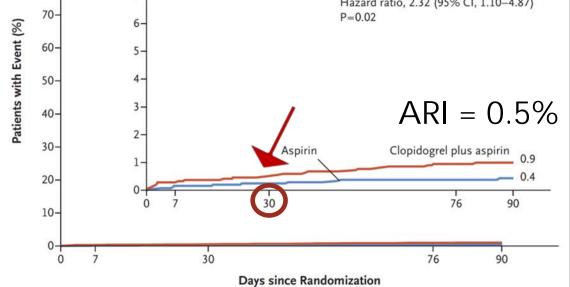

THE MORE THE MERRIER AND SHORTER IS BETTER?

No. of Patients No. with Event
Aspirin 2449 10
I plus Aspirin 2432 23
Hazard ratio, 2.32 (95% CI, 1.10–4.87)

Canadian Stroke Best Practices (June 2018)

"In very high risk TIA patients or minor stroke of non-cardioembolic origin, a combination of clopidogrel and ASA should be given for 21 to 30 days followed by antiplatelet monotherapy (such as ASA or clopidogrel alone)

[Evidence Level A]"

TRUTH CAN BE SAD... DEPRESSING

JAMA | Original Investigation

Prevalence of Prescription Medications With Depression as a Potential Adverse Effect Among Adults in the United States

Dima Mazen Qato, PharmD, MPH, PhD; Katharine Ozenberger, MS; Mark Olfson, MD, MPH

JAMA 2018;319(22):2289-2298

SUICIDE & DEPRESSION AS ADVERSE EFFECTS

eBox 1. List of Medications with Potential Depression Adverse Effects Identified for Inclusion in Study (N=203) a

A. Suicidal Symptoms (n=103) b

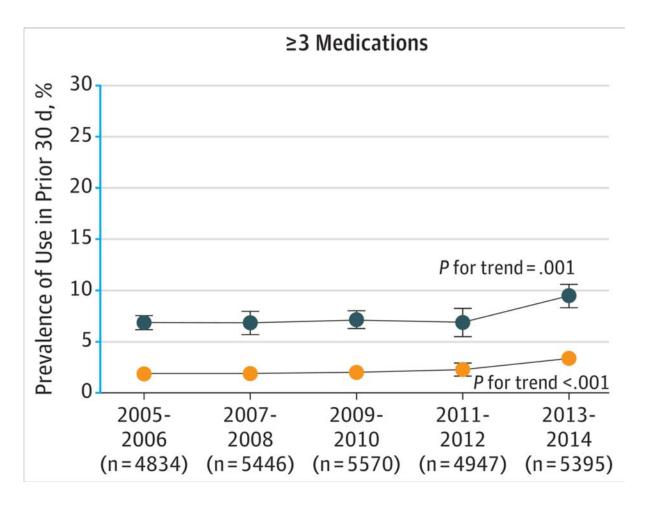

- 1. Analgesics (Acetaminophen/Tramadol, Hydropmorphone, Tapentadol, Tramadol)
- 2. Anticonvulsants (Carbamazepine, Clonazepam, Diazepam, Ethosuximide, Gabapentin, Lamotrigine, Levetiracetam, Lorazepam, Methsuximide, Oxcarbazepine, Phenytoin, Pregabalin, Topiramate, Valproic Acid, Zonisamide)
- 3. Antidepressants (Amitriptyline, Amitriptyline/Chlordiazepoxide, Amitriptyline/Perphenazine, Bupropion, Citalopram, Clomipramine, Desipramine, Desvenlafaxine, Doxepin, Duloxetine, Escitalopram, Fluoxetine, Fluoxetine, Fluoxetine, Fluoxamine, Imipramine, Milnacipran, Mirtazapine, Nefazodone, Nortriptyline, Paroxetine, Phenelzine, Protriptyline, Selegiline, Sertraline, Trazodone, Venlafaxine, Vilazodone)
- 4. Anxiolytics, Hypnotics, and Sedatives (Alprazolam, Butabarbital, Chlordiazepoxide, Clonazepam, Clorazepate, Diazepam, Doxepin, Eszopiclone, Flurazepam, Pentobarbital, Ramelteon, Triazolam, Zaleplon, Zolpidem)
- 5. Gastrointestinal Agents (Metoclopramide)
- 6. Hormones/Hormone Modifiers (Finasteride¹, Leuprolide, Levonorgestrel, Oxandrolone², Progesterone)
- 7. Respiratory Agents (Montelukast, Ribavirin, Roflumilast, Zafirlukast³)
- 8. Other Therapeutic Classes (Acamprosate, Amantadine, Armodafinil, Aripiprazole, Asenapine, Atomoxetine, Carbidopa/Entacapone/Levodopa, Carbidopa/Levodopa, Ciprofloxacin, Dapsone, Efavirenz, Efavirenz/Emtricitabine/Tenofovir, Iloperidone, Interferon Beta-1a, Interferon Beta-1b, Isotretinoin, Lurasidone, Memantine, Mefloquine, Methylphenidate, Modafinil, Moxifloxacin, Naltrexone, Natalizumab, Olanzapine, Ofloxacin, Peginterferon Alfa-2a, Quetiapine, Raltegravir, Risperidone⁴, Rivastigmine⁵, Sibutramine, Tetrabenazine, Varenicline)

B. Depressive (Non-Suicidal) Symptoms (n=100) c

- 1. Analgesics (Cyclobenzaprine, Fentanyl, Acetaminophen/Hydrocodone, Ibuprofen, Indomethacin, Morphine, Nabumetone, Oxycodone)
- 2. Antihypertensives (Atenolol, Atenolol/Chlorthalidone, Betaxolol, Bendroflumethiazide/Nadolol, Brimonidine, Brimonidine/Timolol, Dorzolamide/Timolol, Enalapril, Hydrochlorothiazide/Metoprolol, Hydrocodone, Metolazone, Metoprolol, Nisoldipine, Quinapril, Telmisartan, Timolol, Trandolapril)
- 3. Corticosteroids (Betamethasone, Cortisone, Dexamethasone, Methylprednisolone, Prednisolone, Prednisone, Triamcinolone)
- 4. Gastrointestinal Agents (Atropine/Diphenoxylate, Cimetidine, Dexlansoprazole, Esomeprazole, Famotidine, Omeprazole, Ranitidine)
- 5. Hormones/Hormone Modifiers (Anastrozole, Bicalutamide, Cabergoline, Conjugated Estrogens, Conjugated Estrogens/Medroxyprogesterone,
 Desogestrel/Ethinyl Estradiol, Dienogest/Estradiol, Drospirenone/Ethinyl Estradiol, Drospirenone/Ethinyl Estradiol/Levomefolate, Esterified Estrogens, Esterified Estrogens/Methyltestosterone, Estradiol/Norethindrone, Estropipate, Ethinyl Estradiol/Ethynodiol, Ethinyl Estradiol/Etonogestrel, Ethinyl Estradiol/Norgestrel, Ethinyl Estradiol/Norgestrel, Ethinyl Estradiol/Norgestrel, Etonogestrel, Exemestane, Goserelin, Hydroxyprogesterone, Medroxyprogesterone, Megestrol, Norethindrone, Tamoxifen, Testosterone)
- Respiratory Agents (Cetirizine^δ)
- 7. The drugs do work: antidepressants are effective, study shows

Doctors hope study will put to rest doubts about the medicine, and help to address global under-treatment of depression

Comparative efficacy and acceptability of 21 antidepressant drugs for the acute treatment of adults with major depressive disorder: a systematic review and network meta-analysis

- 522 trials of 21antidepressants in 116,477 participants
 - How depressed were they?
 - Vast majority had moderate-to-severe major depressive disorder
 - Mean HAM-D score = 26

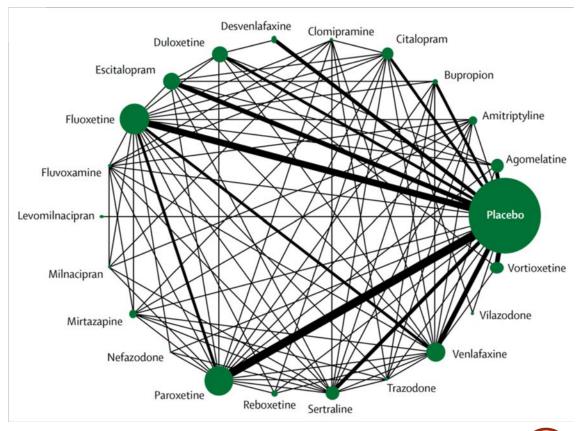

below 7 generally represent the absence or remission of depression

between 7-17 represent mild depression

between 18-24 represent moderate depression

25 and above represent severe depression

- How long were they treated for?
 - Median duration = 8 weeks

≥ 50% response OR (95% Crl) Efficacy (response rate) Amitriptyline 2.13 (1.89-2.41) Mirtazapine 1.89 (1.64-2.20) 1.85 (1.66-2.07) Duloxetine Venlafaxine 1.78 (1.61-1.96) Paroxetine 1.75 (1.61-1.90) Milnacipran 1.74 (1.37-2.23) Fluvoxamine 1.69 (1.41-2.02) Escitalopram 1.68 (1.50-1.87) Nefazodone 1.67 (1.32-2.12) Sertraline 1.67 (1.49-1.87) 1.66 (1.45-1.92) Vortioxetine Agomelatine 1.65 (1.44-1.88) Vilazodone 1.60 (1.28-2.00) Levomilnacipran 1.59 (1.24-2.05) Bupropion 1.58 (1.35-1.86) Fluoxetine 1.52 (1.40-1.66) Citalopram 1.52 (1.33-1.74) Trazodone 1.51 (1.25-1.83) Clomipramine 1.49 (1.21-1.85) Desvenlafaxine 1.49 (1.24-1.79) Reboxetine 1.37 (1.16-1.63) 0.5 1.0 2.5 Favours placebo Favours active drug

WAS THE UK **MEDIA**TELLING THE TRUTH? Some of them, SORT OF...

- But, what does the odds ratio mean?
 → it depends on the placebo response
 - If placebo response = ~40%, AND
 Odds ratio = ~1.6, THEN
 - → Antidepressants add another ~12%

PUT ANOTHER WAY...

"If 10 patients with moderate to severe depression take an antidepressant for two months, five (50%) will report being "better" but in four of them the response will not be because of the drug."

Lancet Feb 21, 2018 BMJ 2018;360:k1073

Are antidepressants EFFECTIVE? → YES

→ Are they GREATLY effective?
Yes, in some cases. No, in many cases.

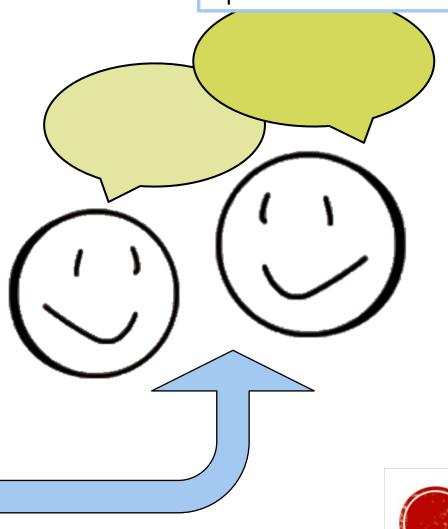

What don't we know very clearly?

- 1. effects on MILDER forms of depression
- 2. effects BEYOND 8 WKS of treatment

AND, these drug are kinda DIRTY, So, BENEFIT: HARM necessitates considerable discussion with patients

GOOD NEWS?

Another reminder to bring care back to the person in front of us

Pharmacies selling DNA tests to help patients pick best medications

Testing gene interactions with drugs is scientifically sound, but some say may not be ready for consumer use

Companies Tout Psychiatric Pharmacogenomic Testing, But Is It Ready for a Store Near You?

Jennifer Abbasi

Article Information

JAMA. 2018;320(16):1627-1629. doi:10.1001/jama.2018.14124

In some cases, "the marketing is way out ahead of the data," Potash said. At the American Psychiatric Association annual meeting in May, Assurex Health publicized positive secondary findings in a large, double-blind, randomized clinical trial of its GeneSight Psychotropic test in major depressive disorder. However, Potash pointed out that the trial did not achieve its primary end point—a greater reduction in the 17-item Hamilton Depression Rating Scale score after 8 weeks than the treatment-as-usual group.

sGLT2i
CLASS
EFFECT

What did it do?

- Adm for heart failure:
 - **↓** 2.3 cases/1000 pts/yr
- NO ↓ in CV death
- those with ≥40% eGFR drop
 - **↓** 3.1 cases/1000 pts/yr

BMJ 2018;363:k5207

CHRISTMAS 2018: LOOK BEFORE YOU LEAP

Key opinion leaders' guide to spinning a disappointing clinical trial result

Adam Hartley and colleagues present a playbook for commenting on trials with disappointing results

THIS JUST IN (NOV 10, 2018)...

SGLT2 inhibitors for primary and secondary prevention of cardiovascular and renal outcomes in type 2 diabetes: a systematic review and meta-analysis of cardiovascular outcome trials

Thomas A Zelniker, Stephen D Wiviott, Itamar Raz, Kyungah <mark>Im,</mark> Erica L <mark>Goodrich,</mark> Marc P Bonaca, Ofri Mosenzon, Eri T Kato, Avivit ann, Remo H M Furtado, Deepak L Bhatt, Lawrence A Leiter, Darren K McGuire, John P H Wilding, Marc S Sabatine

Implications of all the available evidence

These data suggest that SGLT2i should be considered in patients with type 2 diabetes regardless of presence of atherosclerotic cardiovascular disease or history of boart failure, given that SGLT2i safely reduce Hb A_{1c} and reduce the risk of hospitalisation for heart failure and progression of renal disease across a broad spectrum of patients with type 2 diabetes. Reductions in major adverse cardiovascular events can also be expected in patients with established atherosclerotic cardiovascular disease.

Really? Based on what? • If no CVD, ARR HF adm = 0.16%

If no CVD, ARR HF adm = 0.16%
 → NNT = 625/yr

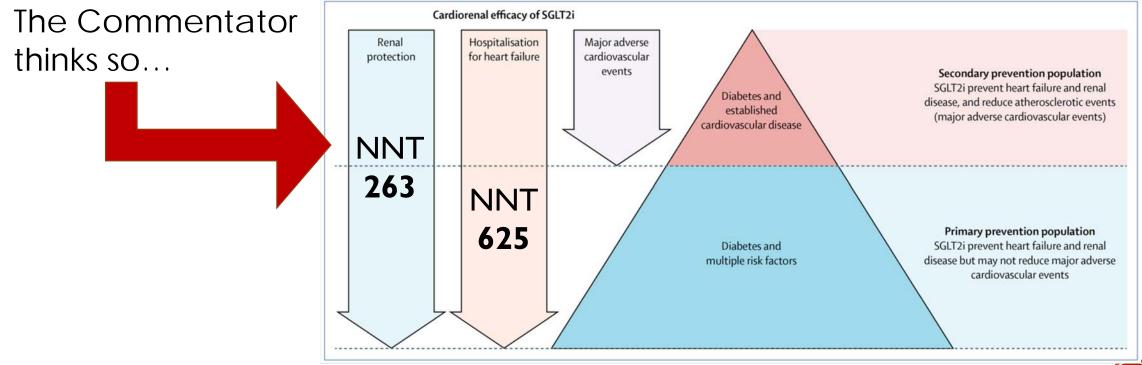

What does that mean?

- ARR HF adm = 0.32% \rightarrow NNT = 313/yr
- ARR renal =0.38% → NNT = 263/yr (driven by ↓eGFR; no diff in ESRD)

Not for dapagliflozin For the other two: ARR MACE = 0.61% → NNT = 164/yr

Pump, pipes, and filter: do SGLT2 inhibitors cover it all?

*Subodh Verma, Peter Jüni, C David Mazer

ONE OF THESE THINGS IS NOT LIKE THE OTHER

- 1. Should we be lumping drugs together just because they're in the same class?
- 2. DPP-4s can probably be lumped together and dumped together

AMAZING NEW DIABETES DRUG

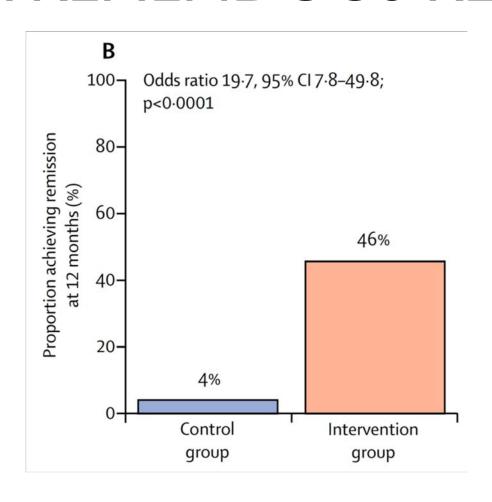

Cluster RCT

- Age 20-65
- Type 2 Diabetes (< 6 years)
- BMI 27-45 kg/m²
- HbA_{1c} < 12% but > 6.0%

OK - NEW DIABETES "DRUG"

Primary care-led weight management

Primary care-led weight management for remission of type 2 diabetes (DiRECT): an open-label, cluster-randomised trial

Michael E J Lean*, Wilma S Leslie, Alison C Barnes, Naomi Brosnahan, George Thom, Louise McCombie, Carl Peters, Sviatlana Zhyzhneuskaya, Ahmad Al-Mrabeh, Kieren G Hollingsworth, Angela M Rodrigues, Lucia Rehackova, Ashley J Adamson, Falko F Sniehotta, John C Mathers, Hazel M Ross, Yvonne McIlvenna, Renae Stefanetti, Michael Trenell, Paul Welsh, Sharon Kean, Ian Ford, Alex McConnachie, Naveed Sattar, Roy Taylor*

Lancet 2018; 391: 541-51

HOW LOSING WEIGHT CAN REVERSE DIABETES

This was deduced from a study conducted between July 25, 2014, and August 5, 2017, among 298 people aged 20-65 and diagnosed with the disease in the past six years

149 were put on weight management programme. Anti-diabetic and blood pressure lowering drugs were all stopped at the start of it. The rest continued with best practice care, including medication

3-step programme

Low-calorie formula diet (825-853 calories daily) for **3-5 months**

Step II Stepped food introduction (2-8 weeks)

Ongoing support for weight loss maintenance with strategies to increase physical activity

A year later

46% of participants who lost weight significantly didn't have diabetes—the highest in those who lost over 15 kilos

NOT FOR EVERYONE...

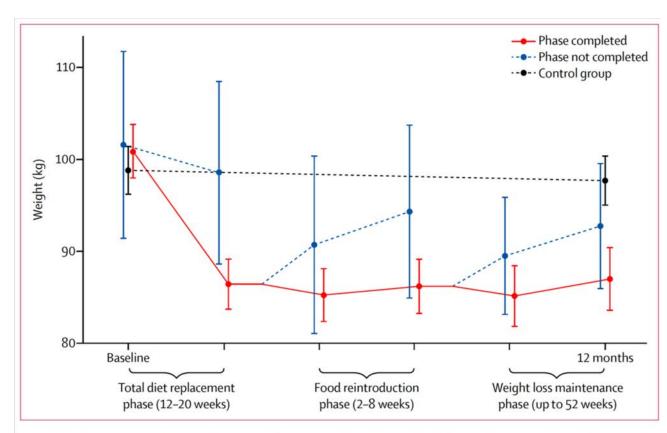

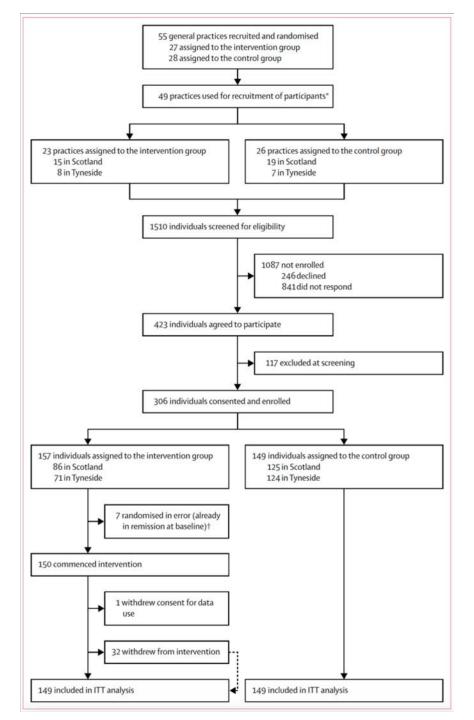

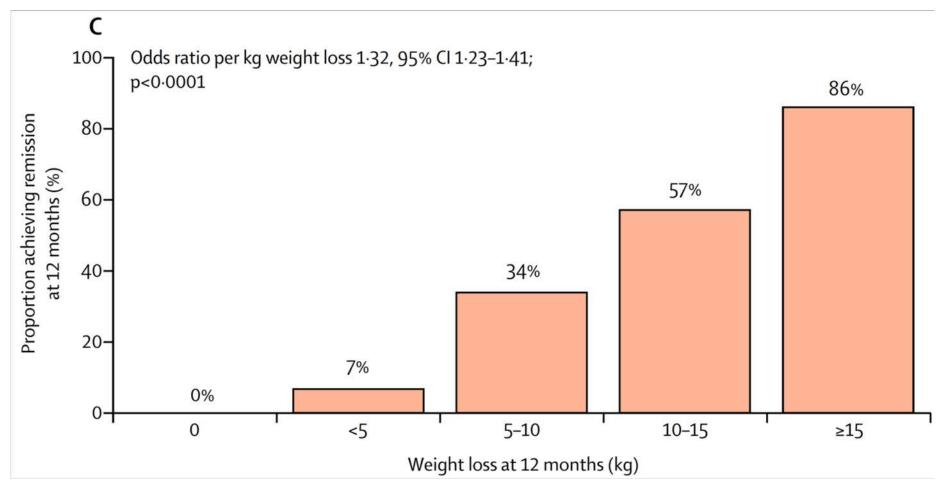

Figure 3: Change in weight of participants who remained in the trial and those who dropped out during each phase of the intervention

NOT FOR EVERYONE – BUT IF IT WORKS...

OPIOIDS IN CHRONIC BACK PAIN

n= 15 trials, 5540 patients, duration = 4-12 wks

"There are no placebo-RCTs supporting the effectiveness and safety of long-term opioid therapy for treatment of CLBP."

TA-DA...

(okay, well it's not placebocontrolled, but it is 1 year long)

JAMA | Original Investigation

Effect of Opioid vs Nonopioid Medications on Pain-Related **Function in Patients With Chronic Back Pain** or Hip or Knee Osteoarthritis Pain The SPACE Randomized Clinical Trial

JAMA 2018;319(9):872-882

the **SPACE** trial

DOES THIS BRING A TEAR TO YOUR EYE?

Intervention Delivery

Medication was delivered using a collaborative pain care model with demonstrated effectiveness.^{9,10} In both groups, pa-

In both groups, pa-

tients received structured symptom monitoring and a treatto-target approach to medication management delivered primarily by a single pharmacist. After randomization, the pharmacist reviewed past medications and identified individual functional goals. The initial medication regimen was determined by the assigned group and considerations such as patient preference and comorbidities.

were adjusted within the assigned group to achieve targets of improved PEG scores and progress toward individual goals. Study medications were dispensed from the VA pharmacy.

CHRONIC BACK PAIN

the SPACE trial

GOOD NEWS?

The drugs we're scared about are no better/a bit worse than the drugs we're less scared of

n = 240 (65% CLBP, 35% OA)

OPIOIDS: Step 1: IR morphine, hydrocodone, oxycodone

Step 2: SR morphine, oxycodone

Step 3: fentanyl patch

NON-OPIOIDS: Step 1: acetaminophen, NSAIDS

Step 2: TCA, gabapentin

Step 3: pregabalin, duloxetine, tramadol

mean MEQ = 21mg/d

NSAID > adjuncts, topicals > acetaminophen >> tramadol

Results_

PAIN → a bit better with non-opioids (0.5 points (0-10))

@ 1 vr

FUNCTION → no difference

ADVERSE EVENTS → a bit more with opioids (0.9 points (0-19)) d/c med → 19% (opioids) vs. 8% (non-opioids)

WHO GETS A TROPHY FOR TREATING ATROPHY?

JAMA Internal Medicine | Original Investigation

Efficacy of Vaginal Estradiol or Vaginal Moisturizer vs Placebo for Treating Postmenopausal Vulvovaginal Symptoms

A Randomized Clinical Trial

JAMA Intern Med 2018;178(5):681-690

- WHO? n=302, mean age = 61 with moderate to severe vulvovaginal symptoms
- Randomized to:
 - Vagifem 10-µg tablet 2X/wk + placebo vaginal gel
 - placebo vaginal tablet + Replens vaginal moisturizer 3X/wk
 - placebo vaginal tablet + placebo vaginal gel 3X/wk
- PRIMARY OUTCOME: Δ in severity of most bothersome symptom (MBS)
 - Severity rating → 0 none, 1 mild, 2 moderate, 3 severe

(MBS at baseline: 60% pain with penetration, 21% dryness, 18% itching, irritation, or pain)

AND THE AWARD GOES TO ... WAIT, WHAT?

- Neither treatment (Vagifem or Replens) ↓ MBS severity more than placebo at 4 or 12 weeks
- ALL GROUPS had a mean

 ↓ of 1.2-1.4-points (i.e. ≥ 50%)
 from baseline by 12 weeks

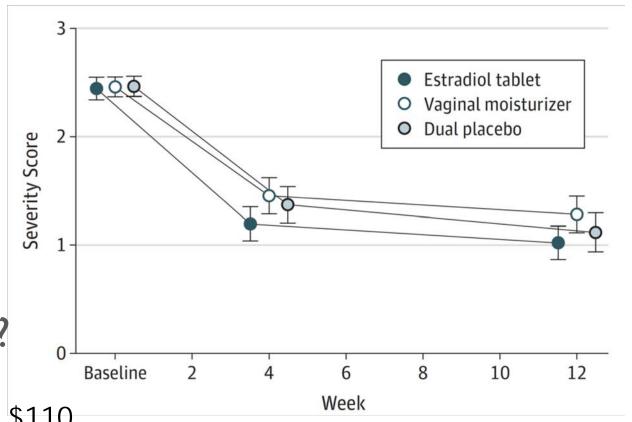

What's preferred by the patient?

Administration/formulation

Cost — 90 days — Vagifem: \$110

Replens: \$68

KY Jelly: \$15

WATER: OUR MOST PRECIOUS RESOURCE

Common recommendation for recurrent UTIs:

↑ hydration → dilution & flushing of bacteriuria is beneficial

EVIDENCE... "sparse and unconvincing"

JAMA Internal Medicine | Original Investigation

Effect of Increased Daily Water Intake in Premenopausal Women With Recurrent Urinary Tract Infections

A Randomized Clinical Trial

JAMA Intern Med 2018;178(11):1509-1515

Effect of Increased Daily Water Intake in Premenopausal Women With Recurrent Urinary Tract Infections A Randomized Clinical Trial

- WHO? n=140 mostly healthy women, mean age = 36
 - Key inclusion → ≥ 3 UTIs in past yr (mean = 3.3)
 → self-reported drinking < 1.5 L of fluid/day (baseline = 1.1 L/d)
 - Exclusions → current UTI, pyelonephritis in past yr, interstitial cystitis, symptomatic vulvovaginitis, or pregnant/lactating
- PRIMARY OUTCOME: frequency of recurrent cystitis
- Secondary outcomes: # of antimicrobial regimens used, mean time between episodes, 24-h urinary hydration measurements

INTERVENTION...

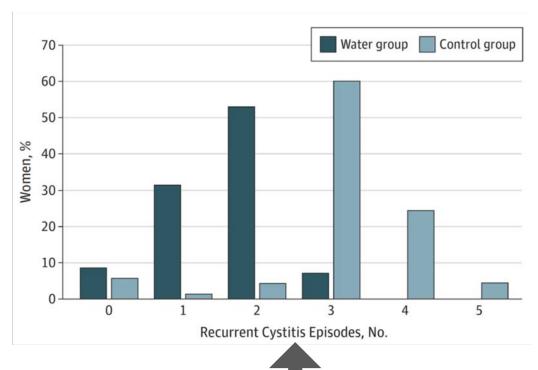

Drink more water for 1 yr:

- 1.5 L of water/d in addition to usual fluid intake vs.
- no additional fluids (control group)

RESULTS

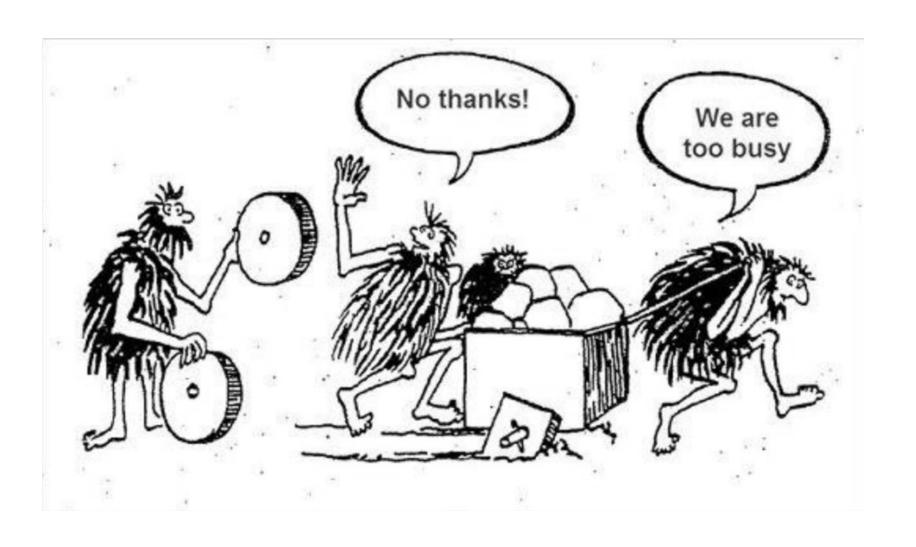

@ 1 year:

- mean fluid intake 1.7 L/d & water intake 1.15 L/d in water group (no change in control group)
- Mean cystitis episodes... 1.7 vs. 3.2
- Antimicrobial regimens...1.9 vs. 3.6
- Not surprisingly...
 - water group peed more (~2 more voids/day)
 - no adverse event differences reported
