SHOULD WE SUMMON **HYGIA?**

Bedtime hypertension treatment improves cardiovascular risk reduction: the Hygia Chronotherapy Trial

Eur Heart J 2019;doi:10.1093/eurheartj/ehz754

- n=19,084 hypertensive patients (on meds or in need of) in northern Spain
- PROBE trial (prospective, randomized, open-label, blinded endpoint)
- Intervention: **all anti-HTN pills in a.m. *vs.* HS** X 6.3 yrs
- Primary CVD outcome (CVD death, MI, coronary revascularization, HF, stroke)

ARR=**5.4%** → **NNT 19**

RESULTS: 48 h mean BP Δ **=1.3/0.9**
Asleep mean BP Δ **= 3.3/1.6**

CVD outcome: HR = **0.55** (0.50-0.61)
CVD death: HR = **0.44** (0.34-0.56)

?

!

SHOULD WE SUMMON **HYGIA?**

A few issues:

Ricky Turgeon PharmD @Ricky_Turgeon · Nov 11, 2019
Replying to @Ricky_Turgeon
2/n FIRST, is this trial actually randomized? It's vaguely described as a PROBE trial (R=randomized), but randomization not mentioned again in methods, figures, discussion. The methods paper describes drug-specific randomization for substudies, but not for this overarching trial

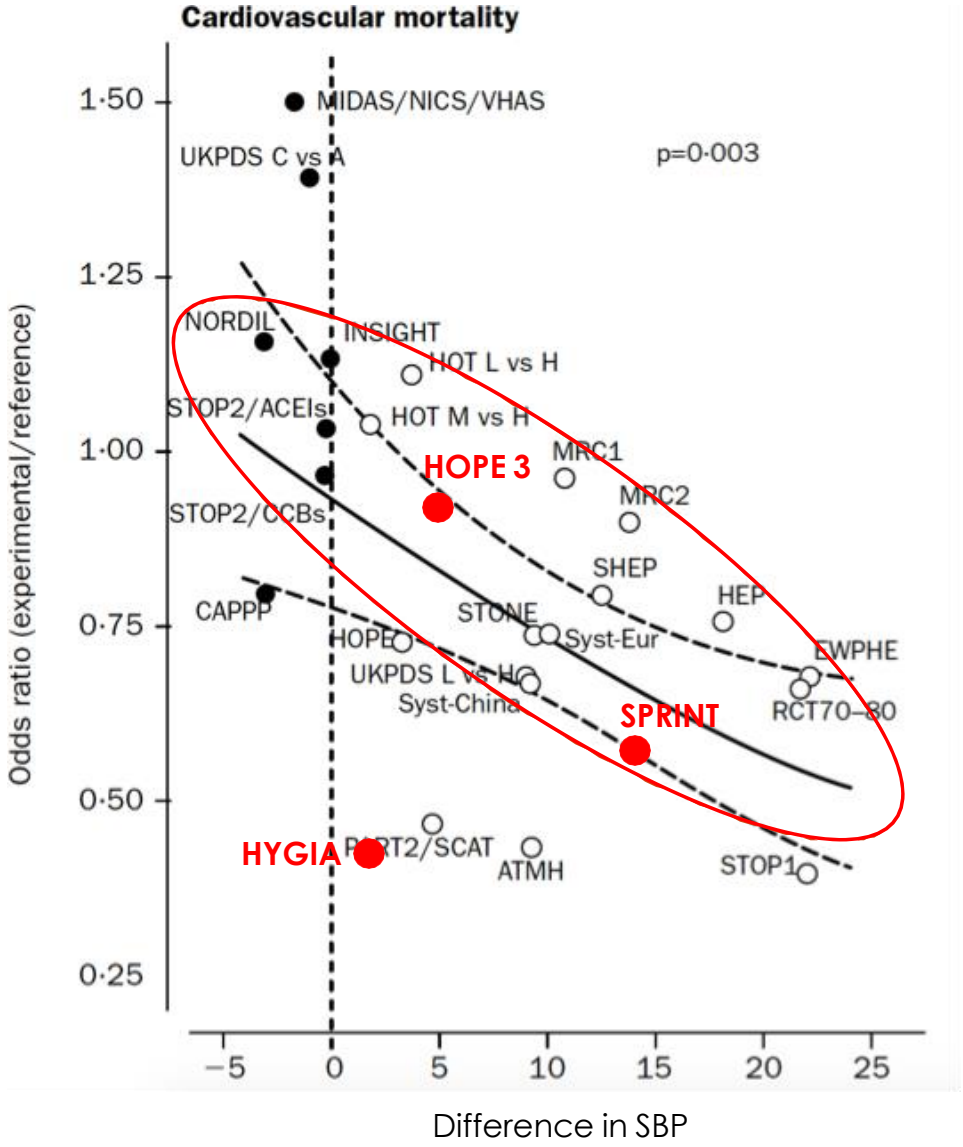
Ricky Turgeon PharmD @Ricky_Turgeon · Nov 11, 2019
3/n Overall, the reporting re: randomization is poor & conflicting. Further unclear is whether allocation was concealed, which is absolutely crucial for a PROBE trial.

Ricky Turgeon PharmD @Ricky_Turgeon · Nov 11, 2019
8/n FIFTH, the outcome definitions. I'd have expected a study that started recruitment in 2007 (or was it 2008? Both are reported) to at least update to one of the Universal Definitions of MI at some point during the decade+ it took them to recruit.

Ricky Turgeon PharmD @Ricky_Turgeon · Nov 11, 2019
10/n Finally, with such an impressive effect estimate & narrow 95% CIs, why was this not stopped earlier on interim analyses? On that note... what exactly was the endpoint to stop the trial? Is it actually finished? Target median f/u was overshot by 1.3 years; sounds expensive

Trial rationale & design (*Chronobio Int* 2016):

> In keeping with ethical requirements, interim analyses are planned every 2 years to identify possible needs for premature interruption of the randomized chronotherapy part of the study.



Lancet 2001; 358: 1305–15

SHOULD WE SUMMON **HYGIA?**

Ricky Turgeon PharmD @Ricky_Turgeon · Nov 11, 2019

7/n Even if targeting asleep/nighttime BP were beneficial, this simply wasn't very different between groups, & the risk reduction here is simply too good to be true based on the differences in this intermediate endpoint.

"These effects are larger than the long-established effects of taking any blood pressure lowering treatment whatsoever, which is difficult to reconcile."

- S. McMahon (George Institute for Global Health)

Many calling for replication:

1) In a blinded trial
2) In a more diverse population

"HEAVY IS GOOD, HEAVY IS RELIABLE.IF IT DOESN'T WORK,YOU CAN ALWAYS HITTHEMWITH IT"

PLOS ONE 2019;14(2): e0212907
https://doi.org/10.1371/journal.pone.0212907

Higher versus lower doses of ACE inhibitors, angiotensin-2 receptor blockers and beta-blockers in heart failure with reduced ejection fraction: Systematic review and meta-analysis

n=14 RCTs
ACEIs (7 studies, n = 5,817)
ARBs (3 studies, n = 4,908)
BBs (4 studies, n = 1,018)

Current landscape:

- HF CPGs recommend titrating ACEIs, ARBs, and BBs to target doses used in pivotal RCTs
- most patients only achieve **~50% of target doses**

HEAVY HIT *vs.* SOFTER TOUCH?

Table 2. GRADE summary of findings. Statistically significant results are shown in **bold text**.

Diabetic ketoacidosis††	3/2368 (0.1)					

PLAN B

BOTTOM LINE:

- DAPA isn't much of a DM2 drug
- DAPA appears to be a pretty good HF drug
- Remember the mitt-ful of drugs they're already on

CREDENCE CANAGLIFLOZIN-WATER REVIVAL

If you can't show a difference in an important uncommon event, what do you do

→ You increase the chance of that event happening

Canagliflozin and Renal Outcomes in Type 2 Diabetes and Nephropathy

N Engl J Med 2019;380:2295-306

WHO: n = 4401 with DM2 + CKD
(eGFR 30-90 (**mean 56**) + albuminuria (mean ACR **105**) on ACEi or ARB)
WHAT: canagliflozin 100mg daily + usual care vs. usual care
Primary Outcome (composite):
ESRD, doubling SCr, or renal or CV death

CREDENCE

	Canagliflozin	Placebo	Hazard Ratio (95% CI)	
	no./total no.			
Efficacy	at 2.6yrs			**ARR**
Primary composite outcome	245/2202	340/2199	0.70 (0.59–0.82)	4.4%
Doubling of serum creatinine level	118/2202	188/2199	0.60 (0.48–0.76)	3.2%
End-stage kidney disease	116/2202	165/2199	0.68 (0.54–0.86)	2.2%
Estimated GFR <15 ml/min/1.73 m^2	78/2202	125/2199	0.60 (0.45–0.80)	
Dialysis initiated or kidney transplantation	76/2202	100/2199	0.74 (0.55–1.00)	**1.1%**
Renal death	2/2202	5/2199	NA	
Cardiovascular death	110/2202	140/2199	0.78 (0.61–1.00)	

Amputation	3.2% (n=70)	2.8% (n=63)	1.11 (0.79-1.56)
Fracture	3.0% (n=67)	3.1% (n=68)	0.98 (0.70-1.37)

BOTTOM LINE:

- We haven't really seen this before
- It's a nice gift basket, but its small & expensive
- Worthy of discussion with DM2 patients with mid-stage CKD

N Engl J Med 2019;380:2295-306

GUIDELINES SANS EVIDENCE?

UNCERTAINTIES *BMJ* 2019;365:l2319 doi: 10.1136/bmj.l2319

Are guidelines for monitoring chronic disease in primary care evidence based?

- Current UK guidelines for monitoring type 2 diabetes, chronic kidney disease, and hypertension are largely based on expert opinion;

WRT: Optimal monitoring strategies and testing frequency:

"None of the recommendations are solely based on evidence. Where evidence is cited it does not address the fundamental question of whether the test in question is necessary or beneficial."

JAMA Open 2019;2(10):e1913315

Invited Commentary | Health Policy

The Important but Rarely Studied Cascade of Care

John Mandrola, MD; Daniel J. Morgan, MD, MS

and minimizing…

What to do…

"These guideline recommendations should feed into, rather than over-ride, discussions with patients that incorporate their values and preferences.
In the absence of clear evidence, it is all the more important that clinicians consider with their patients which tests are likely to influence disease management."

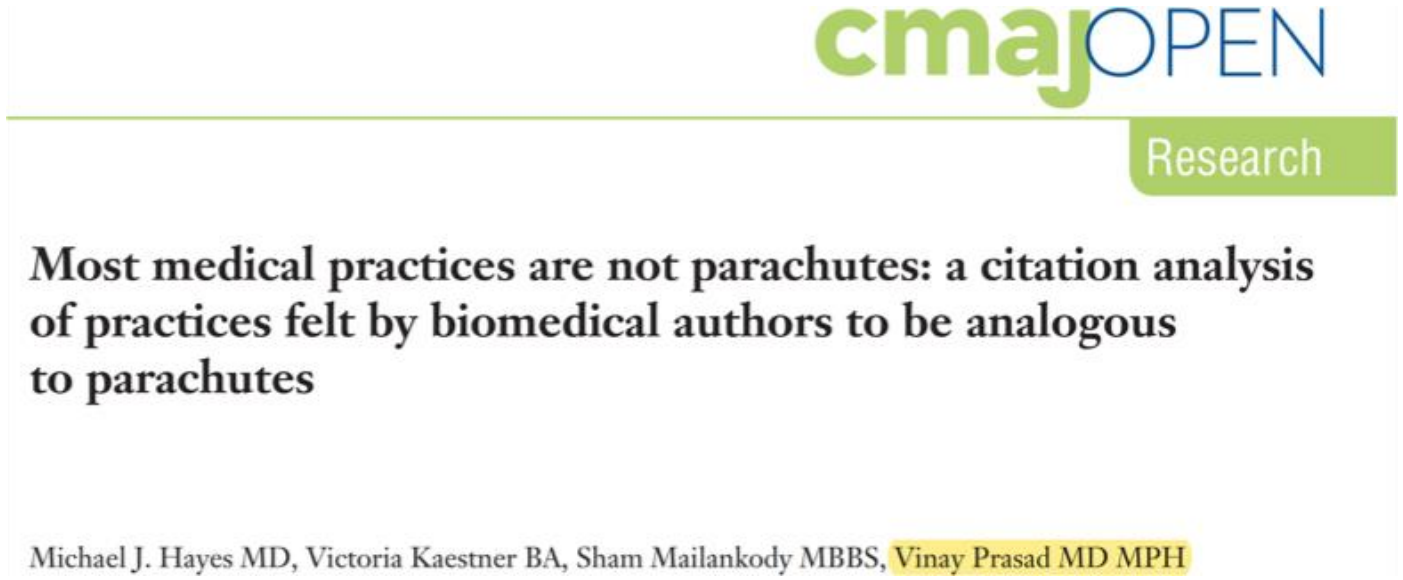
THE PARACHUTE PARADOX?

Parachute use to prevent death and major trauma related to gravitational challenge: systematic review of randomised controlled trials

Gordon C S Smith, Jill P Pell

BMJ 2003;327:1459–61

THE PARACHUTE PARADOX?



THE PARACHUTE PARADOX?

- Chance of death without parachute almost 100% - only scattered case reports of survival
- With a parachute risk of death decreases dramatically to 1.1 deaths per 100 000 jumps → 0.0011%
- ARR approaches 100%

- Is there anything we do in medicine that is like this?

THE PARACHUTE PARADOX?

- 80 000 medical interventions
- Cochrane – only 1 had a reliable evidence of large effect size on mortality – ARR 33%
- *Glasziou* – 16 treatments universally considered beneficial but lack RCTs
- *Djulbegovic* – extended this list to 50
- 50/80000 – 0.06% of medical interventions

THE PARACHUTE PARADOX?

- **Prasad et al systematically looked at the citations of Smith and Pell**
- **Cited 822 times**

THE PARACHUTE PARADOX?

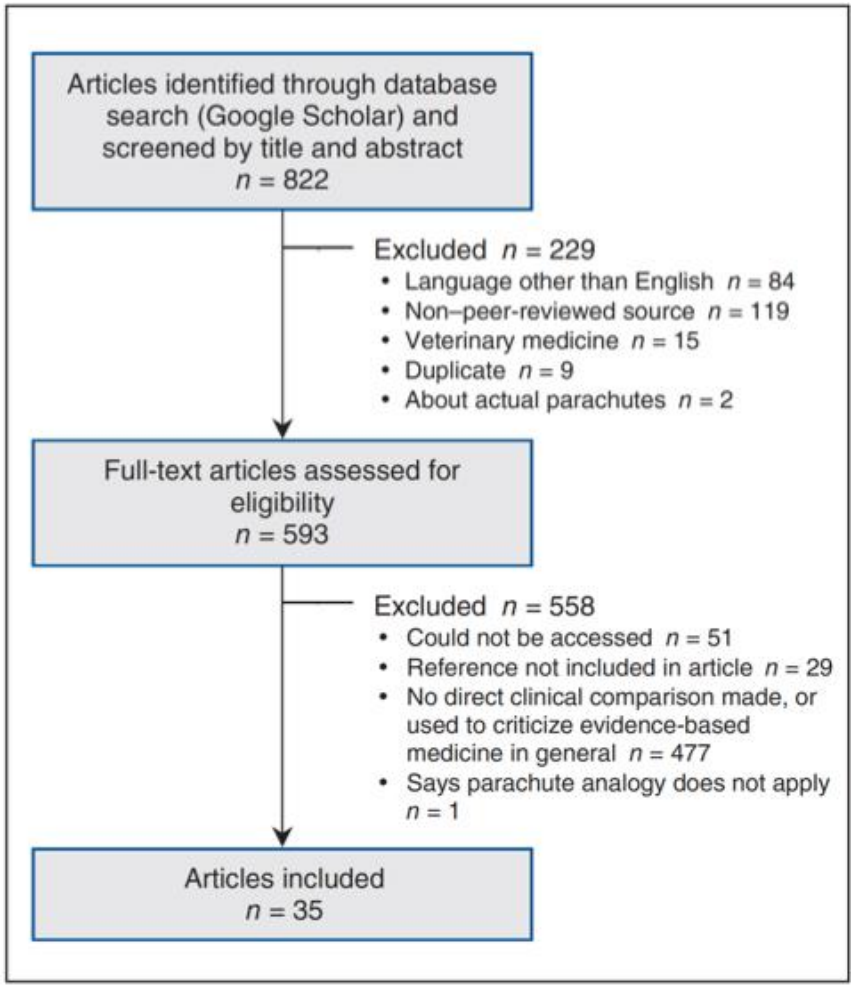


Figure 1: Flow chart showing selection of articles on medical practices analogized to parachutes.

THE PARACHUTE PARADOX?

What they found:

- **Daily flossing no longer recommended because it lacked a rigorous data showing benefit**
- **Long-term flossing was akin to a parachute and may not ethically be tested in a randomized fashion**

cmajOPEN

Statistical analysis

The primary efficacy analysis tested the hypothesis that parachute use is superior to the control in preventing death and major traumatic injury. Based on an assumption of an average jump altitude of 4000 meters (typical of skydiving) and the anticipated effect of impact with the Earth at terminal velocity on human tissue, we projected that 99% of the control arm would experience the primary outcome at ground impact with a relative risk reduction of 95% in the intervention arm. A sample size of 14 (7 in each arm) would yield 99% power to detect this difference at a two sided α of 0.05. In anticipation of potential withdrawal after enrolment owing to last minute anxieties, a total sample size of 20 participants was targeted. Analysis was performed on an intention-to-treat basis. We performed secondary subgroup analyses stratified by aircraft type (airplane *v* helicopter) and previous parachute use through formal tests of statistical interaction.

THE PARACHUTE PARADOX?

Discussion

“Our findings should give momentary pause to experts who advocate for routine use of parachutes”

“The end of routine parachute during jumps from aircraft could save the global economy billions”

Fig 2 | Representative study participant jumping from aircraft with an empty backpack. This individual did not incur death or major injury upon impact with the ground

THE PARACHUTE PARADOX?

Discussion

Power discussion

"The use of softer outcome endpoints, such a level of fear before and after jumping, or its surrogates such as loss of urinary continence, could have yielded more power to detect an effect of parachutes … (however) bias resistant endpoints that are clinically meaningful to all patients increases clinical relevance of the trial"

THE PARACHUTE PARADOX?

Discussion

Trial Registry

Finally, although all endpoints in the study were prespecified, we were unable to register the PARACHUTE trial prospectively. We attempted to register this study with the Sri Lanka Clinical Trials Registry (application number APPL/2018/040), a member of the World Health Organization's Registry Network of the International Clinical Trials Registry Platform. After several rounds of discussion, the Registry declined to register the trial because they thought that "the research question lacks scientific validity" and "the trial data cannot be meaningful." We appreciated their thorough review (and actually agree with their decision).

THE PARACHUTE PARADOX?

Conclusions

- **Trial satirically highlights some of limitations of RCTs**
- **RCT remain gold standard**
- **Accurate interpretation requires more than a cursory glance at the abstract**
- **Requires complete critical appraisal**
- **Challenges in evaluating therapy that is already entrenched in clinical practice**
- **Stronger efforts to ensure definitive trials are conducted before routine practice**

WHAT THIS STUDY ADDS

This randomized trial of parachute use found no reduction in death or major injury compared with individuals jumping from aircraft with an empty backpack

Lack of enrolment of individuals at high risk could have influenced the results of the trial

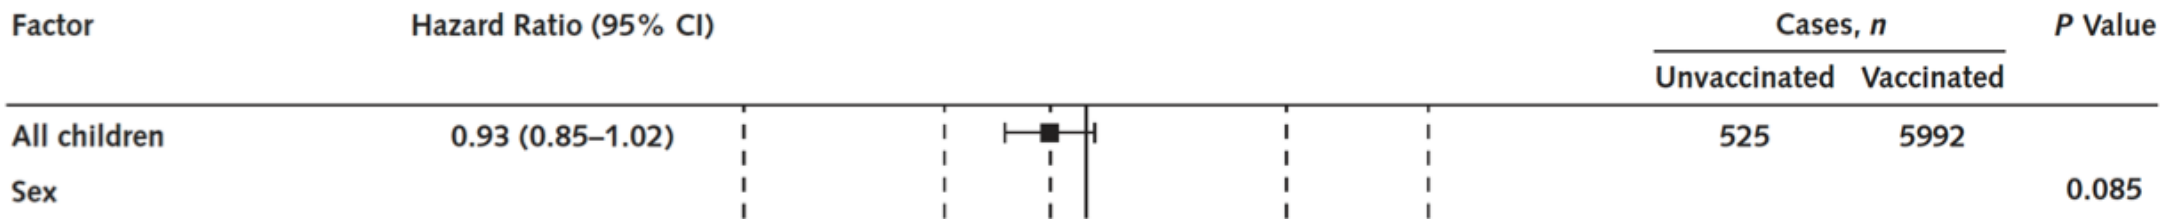
Measles, Mumps, Rubella Vaccination and Autism

A Nationwide Cohort Study

Anders Hviid, DrMedSci; Jørgen Vinsløv Hansen, PhD; Morten Frisch, DrMedSci; and Mads Melbye, DrMedSci

Figure 3. Association between measles, mumps, rubella vaccination and autism in subgroups of 657 461 children born in Denmark between 1 January 1999 and 31 December 2010.



Factor	Hazard Ratio (95% CI)	Cases, *n*		*P* Value
		Unvaccinated	Vaccinated	
All children	0.93 (0.85–1.02)	525	5992	
Sex				0.085

Ann Intern Med 2019;170:513-520. doi:10.7326/M18-2101

CONSEQUENCES?

First Case of Pediatric Tetanus in Oregon in >30 years

- 6yr old boy laceration on forehead on farm – cleaned and sutured at home
- 6 days later jaw clenching and spasm
- Air-lifted to tertiary pediatric medical centre
- 8 weeks impatient care
- Metronidazole, Tetanus immune globulin, DTaP
- IV meds for pain, blood pressure, neuromuscular blockade
- 44 days on ventilator
- Total cost $811,929 (excluding air transport, inpatient rehabilitation, and ambulatory follow up costs)

Despite extensive review of the risks and benefits of tetanus vaccination the family declined a second dose of DTaP and any other recommended immunizations

Notes from the Field

Tetanus in an Unvaccinated Child — Oregon, 2017

"measles causes elimination of 11 - 73% of the antibody repertoire"

THIS AGAIN? … PART 1

Inaugural MEDS Conference 2015:

1450-1515 Lipids: Using evidence to simplify management

Mike Allan - ***20 min talk & 5 min Q & A – total of 25 minutes***

What do we know:

1. **LDL contributes to CVD** & lowering it is associated with lower CVD risk
2. **High-dose statins** in secondary prevention lower CVD events a bit better than moderate-dose statins (e.g. PROVE-IT, TNT, IDEAL)
3. **Specific LDL targets** have **not** been established using RCTs

UNTIL NOW! …Jan 2, 2020:

N Engl J Med 2020;382:9-19

The NEW ENGLAND JOURNAL of MEDICINE

A Comparison of Two LDL Cholesterol Targets after Ischemic Stroke

The NEW ENGLAN
JOURNAL of MEDIC

A Comparison of Two LDL C
after Ischemic S

N Engl J Med 2020;38

WHAT WE KNOW HASN'T REALLY CHANGED:

1. Moderate to high-dose statins reduce CVD outcomes in secondary prevention
2. Checking LDL routinely won't change what we do with #1, but will add burden to patients and clinicians

WHO: n=2860 with recent stroke or TIA

WHAT: target LDL **<1.8** vs. **<2.8** mmol/L (LDL checked q6m) X 3.5 yrs

Composite PRIMARY ENDPOINT:

- major CV events (stroke, MI, urgent coronary/carotid revasc, or CV death)

Caveats:

- stopped early & non-blinded

RESULTS:

HR 0.78 (0.61-0.98), **ARR = 2.4%**

→ Fatal CV events, ARR = 0.5% (NSS)

IF we're excited about 2.4% over 3.5 yrs, was it a target LDL that did the trick?

Statin only	@ 3 yrs **LDL<1.8** (1.7)	**LDL<2.8** (2.5)
Intense statin therapy*	73/310 (23.6)	38/446 (8.5)
Moderate intensity statin therapy**	235/310 (75.8)	315/446 (70.6)
Low intensity statin therapy***	2/310 (0.6)	93/446 (20.9)

* Atorva 40-80, Rosuva 10-40
** Atorva10-20, Rosuva 5-10, Simva 20-40, Prava 40-80
*** Simva 10, Prava 10-20

THIS AGAIN? … PART 2

MEDS Conference 2018:

JAMA Internal Medicine | Original Investigation

Effect of Statin Treatment vs Usual Care on Primary Cardiovascular Prevention Among Older Adults
The ALLHAT-LLT Randomized Clinical Trial

JAMA Intern Med 2017;177(7):955-965

Lancet 2019; 393: 407–15

Efficacy and safety of statin therapy in older people: a meta-analysis of individual participant data from 28 randomised controlled tri

	Events (% per annum)		RR (CI) per 1 mmol/L reduction in LDL cholesterol
	Statin or more intensive	Control or less intensive	
Participants without vascular disease			
≤55 years	290 (0·8)	408 (1·2)	0·68 (0·56–0·83)
>55 to ≤60 years	350 (1·0)	415 (1·2)	0·81 (0·67–0·99)
>60 to ≤65 years	416 (1·1)	545 (1·5)	0·73 (0·61–0·87)
>65 to ≤70 years	374 (1·2)	581 (1·8)	0·61 (0·51–0·73)
>70 to ≤75 years	400 (2·1)	462 (2·4)	0·84 (0·70–1·01)
>75 years	295 (2·7)	308 (2·8)	0·92 (0·73–1·16)
Total	**2125 (1·3)**	**2719 (1·6)**	**0·75 (0·71–0·80)**
Trend test χ^2_1=3·85 (p=0·05)			
Participants with vascular disease			
≤55 years	1927 (4·0)	2370 (5·1)	0·77 (0·71–0·83)
>55 to ≤60 years	1391 (4·2)	1692 (5·2)	0·80 (0·73–0·88)
>60 to ≤65 years	1822 (4·4)	2178 (5·3)	0·81 (0·75–0·88)
>65 to ≤70 years	1889 (4·3)	2286 (5·5)	0·79 (0·73–0·86)

Mathew, BMJ 2019;364:l807

WHAT WE KNOW HASN'T REALLY CHANGED:

1. Don't check cholesterol in those >75
2. Don't offer statins for primary prevention for those >75
3. Discuss uncertainty with those >75 who have been on statins for awhile

"…we do need to challenge the prevailing dogma of "prevention at all costs" – and create a broader vision of how to help people live successfully to the very end of their lives."

LESS IS MORE FOR ACUTE MSK PAIN?

Cochrane Library *2015, Issue 7. Art. No.: CD007789*

Oral non-steroidal anti-inflammatory drugs versus other oral analgesic agents for acute soft tissue injury (Review)

"There is generally low- or very low-quality but consistent evidence of no clinically important difference in analgesic efficacy between NSAIDs and other oral analgesics."

Let's ramp up the evidence…

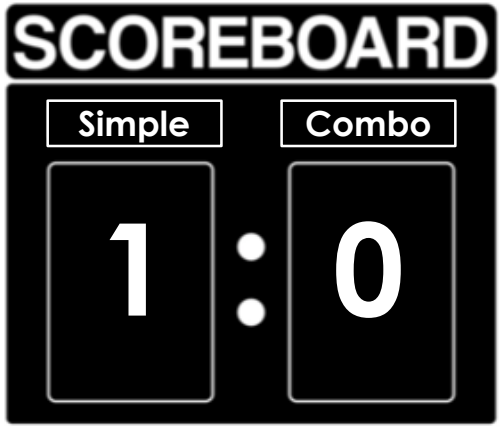
Naproxen With Cyclobenzaprine, Oxycodone/Acetaminophen, or Placebo for Treating Acute Low Back Pain
A Randomized Clinical Trial
JAMA 2015;314(15):1572-1580

X 10 day course (n=323)

RESULTS:

→No functional benefit of adding cyclobenzaprine or opioids to naproxen @ 1 week post-ER

→NNH (combo) = 5



LESS IS MORE FOR ACUTE MSK PAIN?

Oral Paracetamol Versus Combination Oral Analgesics for Acute Musculoskeletal Injuries

Ann Emerg Med 2019;74:521-529

- **WHO:** n=119 with acute (<48 hours) closed limb or trunk injuries in ED with moderate pain (mean score 5.8/10 (rest), 8.4/10 (activity))
- **WHAT:**

  acetaminophen 1g + ibuprofen 400mg + codeine 60mg X 1 dose
  ***vs.* acetaminophen 1g X 1 dose**

- **ENDPOINTS:**
  1. Change on VAS pain scale
  2. Rescue meds
  3. Adverse events

Types of injury, No. (%)	Combination (n=60)	Paracetamol (n=59)
Sprain	40 (66.7)	31 (52.5)
Fracture	7 (11.7)	14 (23.7)
Contusion	13 (21.7)	12 (20.3)

LESS IS MORE FOR ACUTE MSK PAIN?

Table 2. Pain reduction and differences between treatments in change of mean pain scores (out of 10) at 60 minutes.

Reduction in Pain	Combination (n=59)	Paracetamol (n=59)	Mean Difference	*P* Value*
Pain at rest (95% CI)	−2.0 (−2.5 to −1.5)	−1.6 (−2.0 to −1.1)	−0.4 (−1.1 to 0.3)	.26
Pain with activity (95% CI)	−1.8 (−2.3 to −1.3)†	−1.6 (−2.1 to −1.1)	−0.2 (−0.9 to 0.5)	.58

Table 3. Pain reduction and differences between treatments in change of mean pain scores (out of 10) at 120 minutes.

Reduction in Pain	Combination (n=35)	Paracetamol (n=30)	Mean Difference	*P* Value*
Pain at rest (95% CI)	−2.9 (−3.7 to −2.2)	−2.4 (−3.2 to −1.6)	−0.5 (−1.6 to 0.5)	.36
Pain with activity (95% CI)	−3.0 (−3.8 to −2.2)†	−1.9 (−2.8 to −1.0)	−1.1 (−2.3 to 0.1)	.04

Outcome	Combination (n=60)	Paracetamol (n=59)	Relative Risk (95% CI)
Received rescue analgesia, No. (%)	5 (8.3)	4 (6.8)	1.2 (0.4–4.4)
Adverse effects, No. (%)			
Nausea or vomiting	2 (3.3)	0 (1.7)	Not calculable
Drowsiness, dizziness, or light-headedness	10 (16.7)	5 (8.5)	2.0 (0.7–5.4)
Other*	4 (6.7)	0	Not calculable
Total†	14 (23.3)	5 (8.5)	2.8 (1.1–7.2)
