AMALGAM RESTORATIONS

- • Introduction
- • Composition of Amalgam
- • Indication and contra-indications of its use
- • Hazards: toxicity and prevention
- • Step by step
 - – Proper technique
 - – Trituration
 - – Condensation
 - – Carving
 - – Finishing and polishing

Property of the University of Manitoba

Introduction

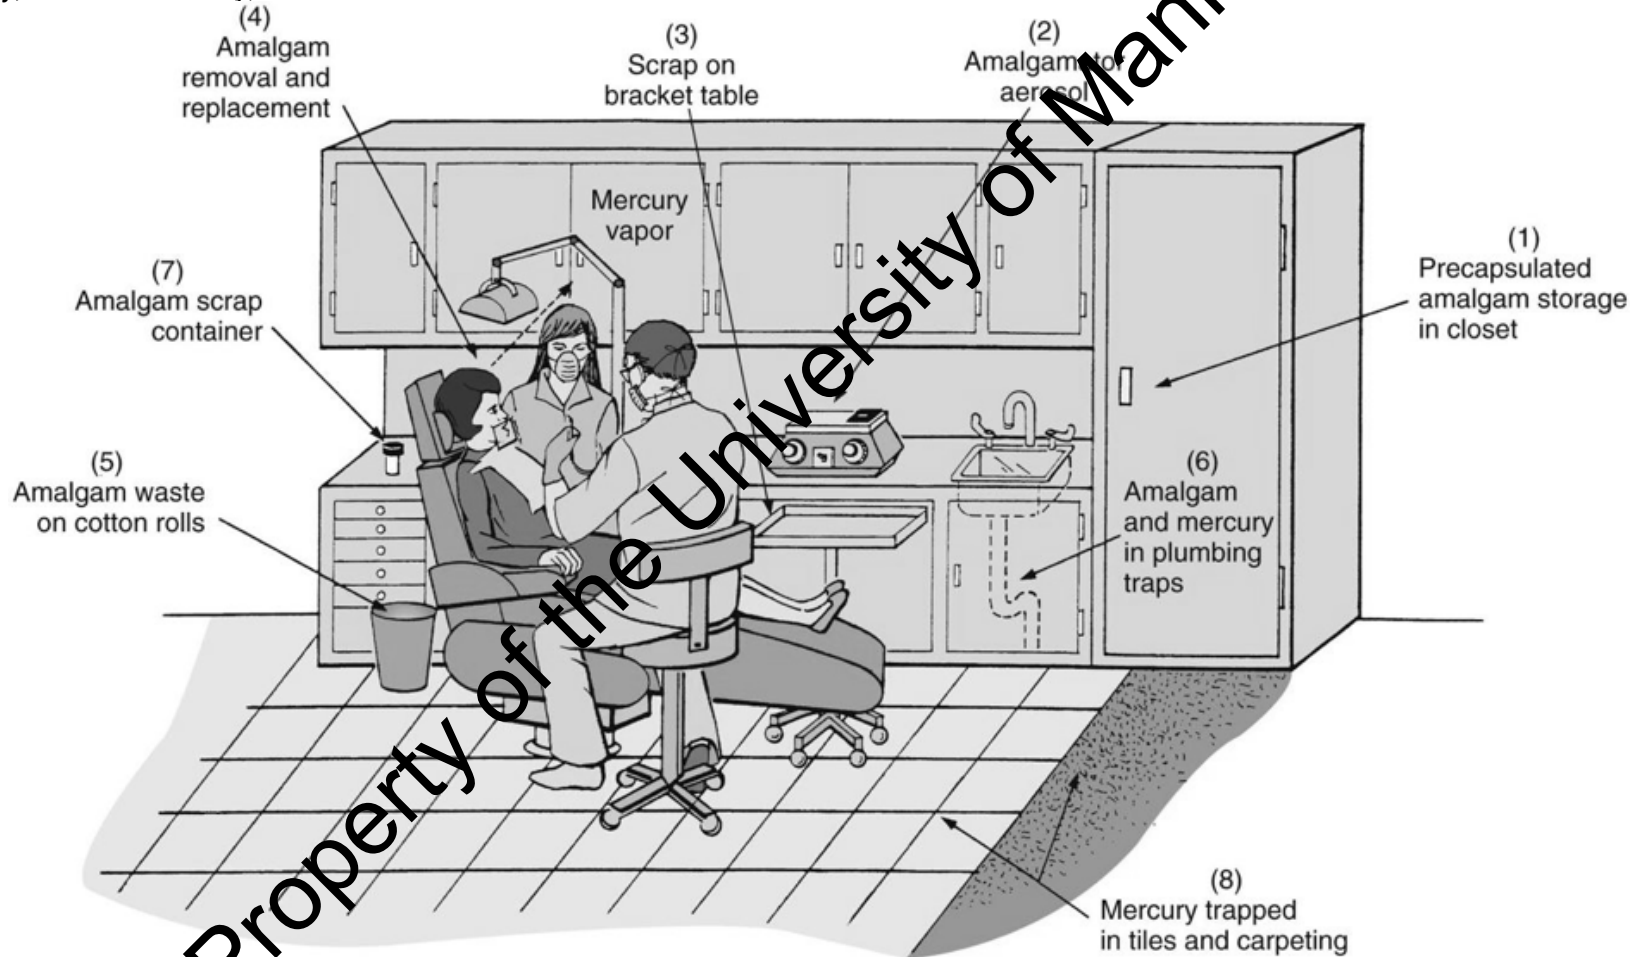

- *Amalgam* = alloy of mercury (Hg) with any other metal
- *Dental amalgam*
- Alloy made by mixing mercury with silver-tin (Ag-Sn) alloy
- Along with varying amounts of copper (Cu) and small amounts of zinc (Zn).
- *** The use of amalgam is declining***

Sources of mercury hazards in the dental operator

Heymann, Harold, Edward Swift, Andre Ritter. *Sturdevant's Art and Science of Operative Dentistry*, 6th Edition. Mosby, 2013. VitalBook file.

- (1) some mercury vapor released from stored materials;
- (2) small losses from capsules during trituration;
- (3) spillage during manipulation for tooth restorations;
- (4) some vapor exposures to the dentist, the assistant, and the patient during removal, placement, or finishing or polishing of amalgam;
- (5) contamination of cotton rolls;
- (6) collection of debris via vacuum suction into the plumbing system and the sewer system;
- (7) collection of remnants in a jar for recycling; and
- (8) mercury trapped

Summary: Mercury – Use and Abuse

Mercury - It's use and abuse Heymann, Harold, Edward Swift, Andre Ritter. *Sturdevant's Art and Science of Operative Dentistry, 6th Edition.* Mosby, 2013.

- Proper mercury hygiene;
 - – Rubber dam
 - – Gloves
 - – Masks
 - – High Volume Suction
 - – Office ventilation
- • Prevention checklist – see manual pg 28.

AMALGAM RESTORATIONS

- The quality of the amalgam restoration depends on:
 - Composition
 - Manipulation
 - Placement
 - Finishing

Property of the University of Manitoba

TYPES OF AMALGAM

- **Composition of the alloy**
- Low copper/High copper
- **Particle size & shape**
- Lathe-cut A
Spherical B,
Admixed C

Property of the University of Manitoba

Before you start

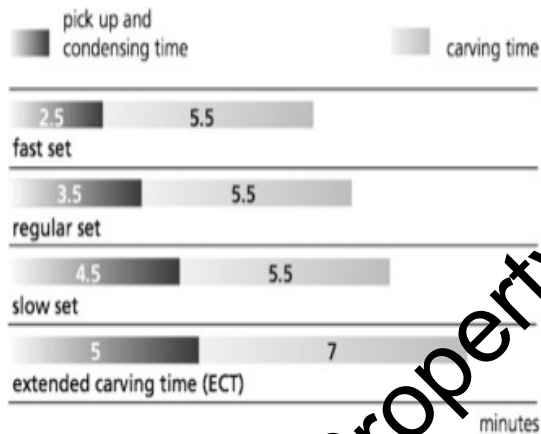

- Know your material: type of amalgam, pick up/condensing time and carving time

Before you start

- Know your material: type of amalgam, pick up/condensing time and carving time

Amalgam: Permite® (SDI)

- Non-gamma 2
- **Admix**

Physical properties

composition	Ag 56%, Sn 27.9%, Cu 15.4%, In 0.5%, Zn 0.2%, Hg 47.9%
alloy particle	spherical and lathe cut
compressive strength @ 1 hour	260MPa (37,700psi)
compressive strength @ 24 hours	500MPa (72,500psi)
diametral tensile strength @ 1 hour	28MPa (4,060psi)
diametral tensile strength @ 24 hours	54 MPa (7,830 psi)
static creep @ 7 days	0.2%
dimensional change @ 24 hours	+4µm/cm

Before you start Have your instruments handy

Property of the University of Manitoba

TRITURATION (MIXING)

- Amalgamator
- Follow manufacturers recommended Time and Speed
- Compress capsule to activate and place in amalgamator

TRITURATION (MIXING)

- Characteristics of mix:
- Over-mixed: overly shiny and mushy.
- Under-mixed: dull, crumbly, non-cohesive
- Proper mix: shiny, smooth, cohesive and “squeaks” when condensed

TRITURATION (MIXING) PLACEMENT

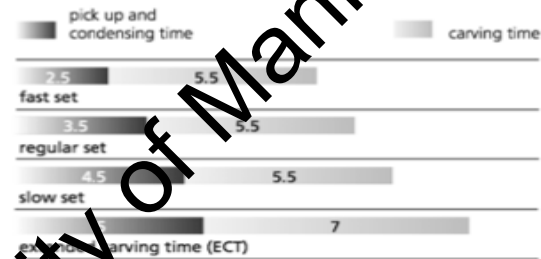

Once some of the amalgam is picked up with the carrier, the increment is the

CONDENSATION Technique

Images: Baratieri, Monteiro Jr, Melo et al. (2014) Routes for excellence in restorative dentistry

- Condensed in small increments using
- A “stepping” technique:
- Overlapping steps - minimize porosities and increase strength
- Do not delay between layers – want good adaption of increments
- If Ag becomes dry and difficult to pick up in carrier Should discard and get fresh mix
- Overfill preparation slightly

CONDENSATION: Technique

- Condenser size:
- Starting with the smallest condenser nib and progressing to larger ones. The largest condenser used at the cavo-surface margins.
- Condensing direction:
- Vertical against pulpal and gingival floors
- Lateral at internal angles and proximal box
- Perpendicular at cavo-surface margins.
- ** Condensation: heavy condensation pressure
- Images: Baratieri, Montenegro, Melo et al. (2014) Routes for excellence

Property of the University of Manitoba

CARVING

- Burnish amalgam before carving
- Move instrument from *tooth* to *amalgam* not vice versa – may cause a “ditched” margin.
- Rest instrument on tooth and amalgam using tooth to guide your anatomy-track through the developmental grooves.
- The Tip of the instrument will create the central groove.
- Recreate functional anatomy

Images: Baratieri, Monteiro Jr, Melo et al. (2014) *Annals for excellence in*

Property of the University of Manitoba

CARVING

- Margins – amalgam and tooth
- margin form butt joint
- – No deficiencies (open margin or sub marginal defect)
- – Overextension (flash)
- • Gently use explorer to assess
- margins
- • Burnish amalgam after carving completely
- Images: Baratieri, Monteiro Jr, Melo et al. (2014) Routes for excellence

Property of the University of Manitoba

OCCLUSION CHECK and post-operative instructions

- Remove the rubber dam
- Using an articulating paper,
- ask the patient to bite gently
- Remove any excess
- Redo until patient is comfortable and occlusion is acceptable.
- Post-op instructions: advise the patient to chew on the opposing side for 24 hours.

Property of the University of Manitoba

FINISHING AND POLISHING

- Done 24 hours after Amalgam placement to allow for full setting
- **Finishing** – correction of minor errors in contour, occlusion, anatomy and removal of flash.
- **Polishing** – Smoothing the surface of the restoration to a high gloss.
- Accomplished with:
 - – burs
 - – abrasive points,
 - – polishing points and polishing pastes.

Images: Baratieri, Monteiro Jr, Melo et al. (2014) Routes for excellence in restorative dentistry

Property of the University of Manitoba

Freshly carved amalgam vs Polished amalgam

Property of the University of Manitoba

Summary

A successful & functional restoration should possess proper :

- Margins
- micro-leakage & recurrent caries
- Anatomy
- Physiologic function
- Contours
- Not adversely affect periodontal health

Property of the University of Manitoba

CLASS I

Property of the University of Manitoba

Condense into all internal angles first

Property of the University of Manitoba

Use existing anatomy as a carving aid

Property of the University of Manitoba

Final product

Property of the University of Manitoba

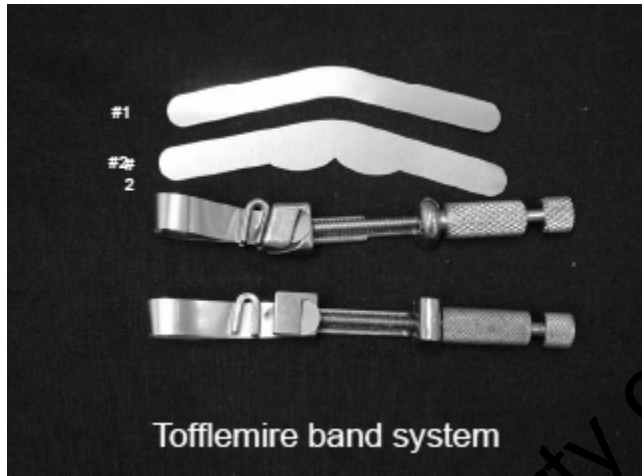

- CLASS II

Property of the University of Manitoba

Matrix System

Property of the University of Manitoba

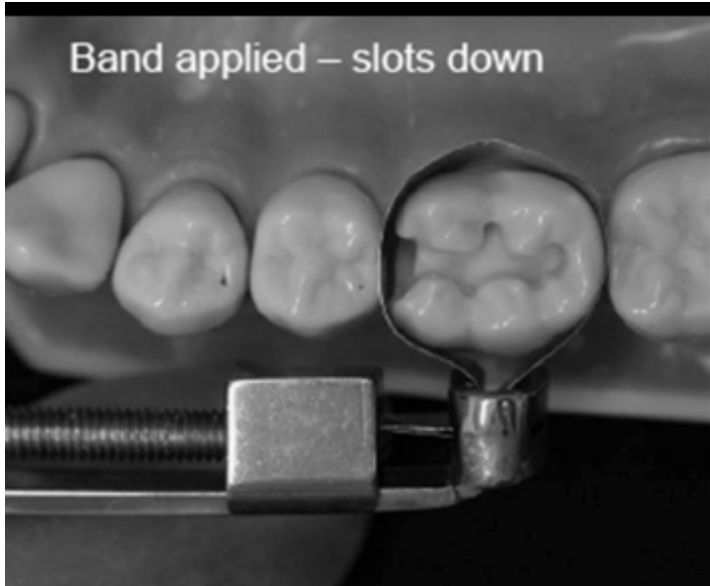

Matrix and Wedging

Property of the University of Manitoba

Amalgam Placement

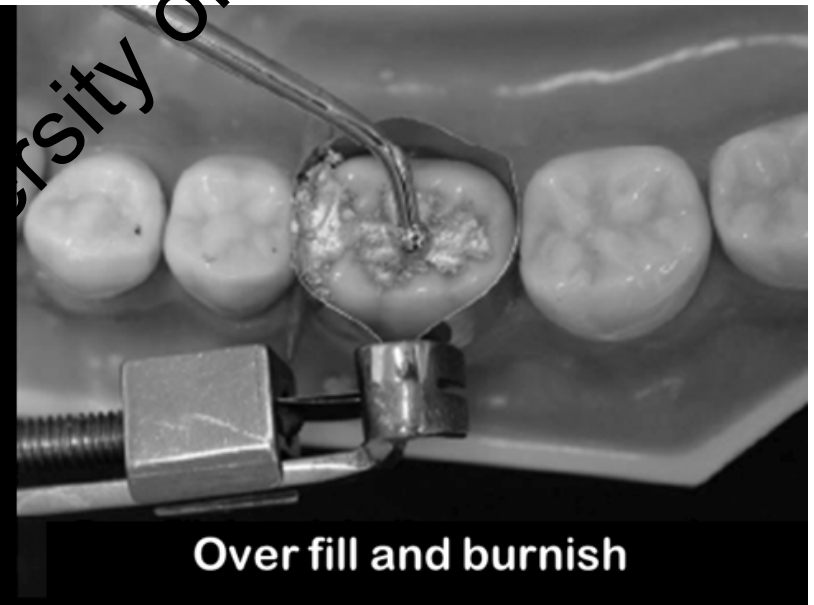

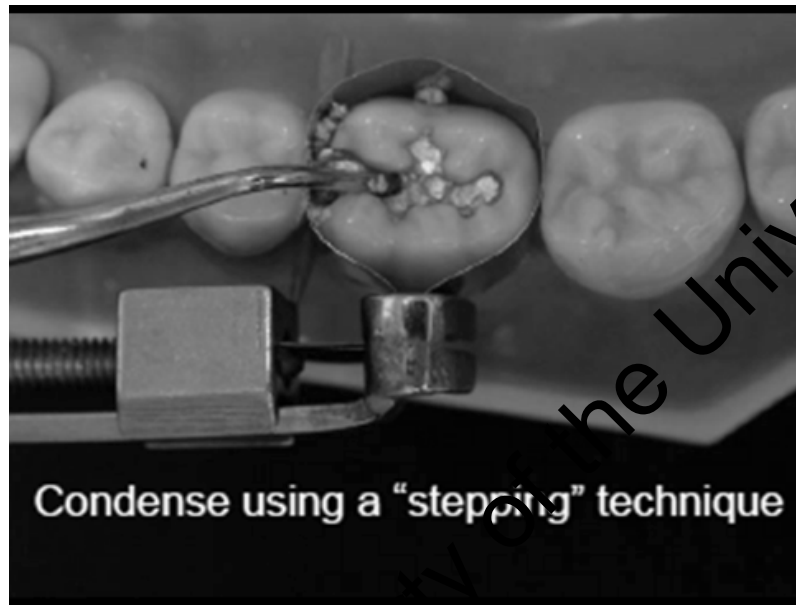

First application – in deepest area

Property of the University of Manitoba

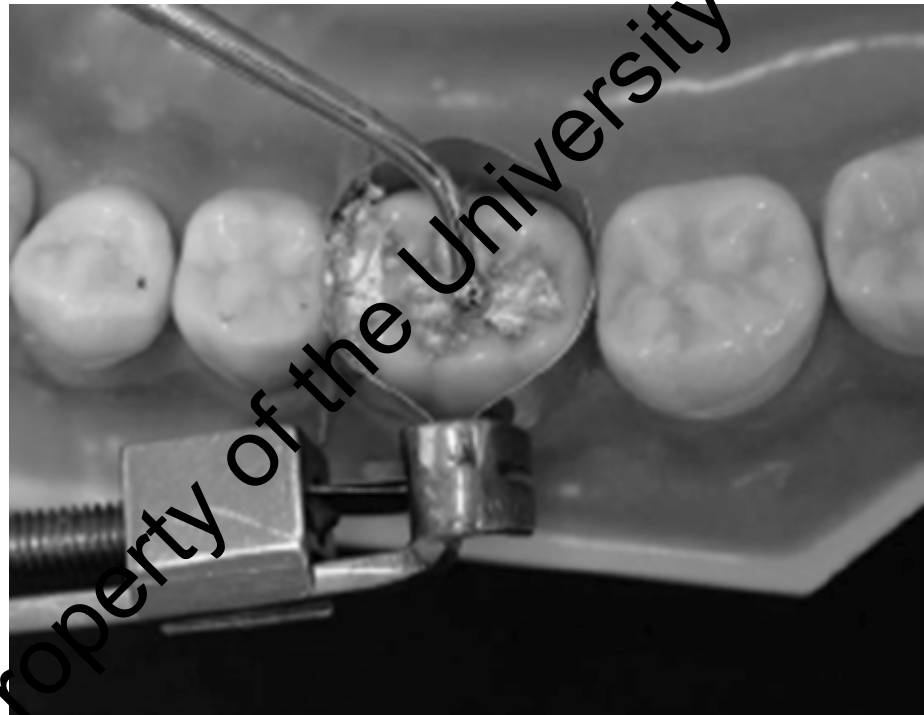

Fill in increments Smallest condenser

Property of the University of Manitoba

Burnish

Initial anatomy

Property of the University of Manitoba

UNIVERSITY
OF MANITOBA

Rady Faculty of
Health Sciences

Prior to Band Removal

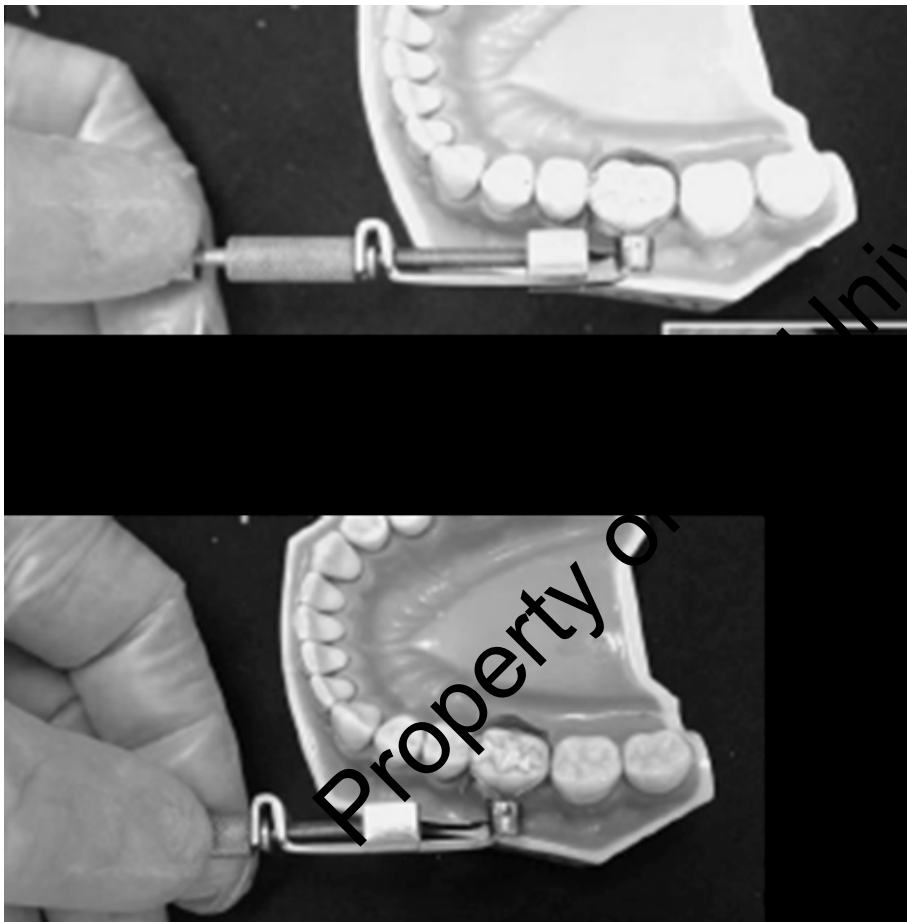

- Use explorer to gently remove excess amalgam around band
- to create occlusal embrasure
- space & MR height.
- • Hold tip at 45 degrees to band &
- tip should touch band at all
- times or else ledge may form.

Property of the University of Manitoba

Remove Band

- Turn set screw to
- release the band
- Turn spindle to
- move the
- slide and expand
- the band

Property of the University of Manitoba

Remove tofflemire holder
Remove band from non-restored
side of tooth

Band removal

Remove wedge with
cotton
pliers

Gently seesaw band
from
restored contact

Key Points

Can use tip of large condenser to stabilize MR.

Can be susceptible to fracture with band removal.

Property of the University of Manitoba

Carving

Note: flash – slight excess

Use explorer to remove flash & overhangs

- Take care not to gouge amalgam with explorer tip!

Property of the University of Manitoba

Once carving is complete, burnish once more.

Class II Amalgam

Reproduce ideal:

- Contact
- Position
- Size
- Embrasures
- Occlusal
- Gingival
- Vestibular
- Lingual
- Occlusal Anatomy
- As patient's occlusion allows

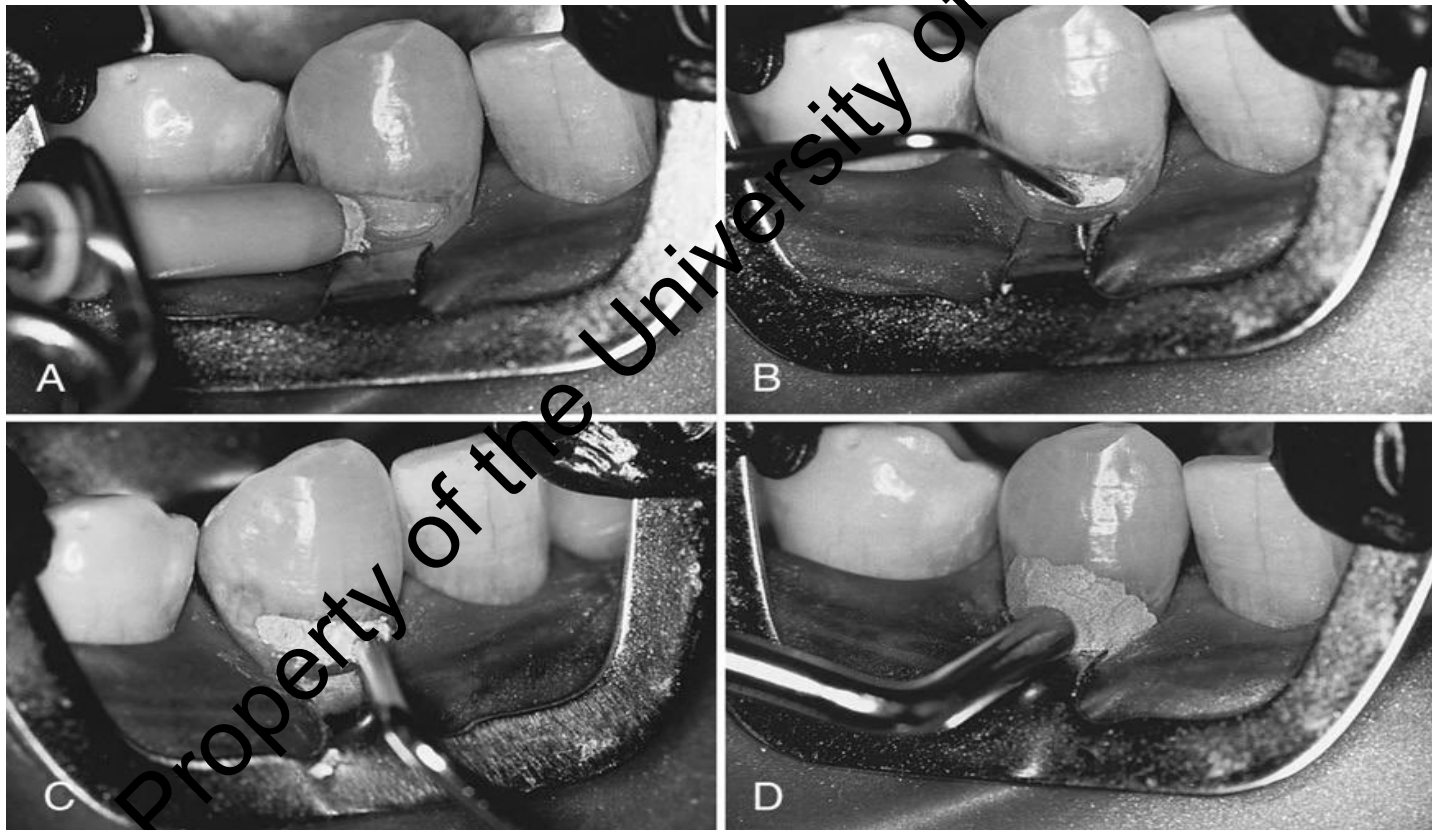

Contacts and Occlusion

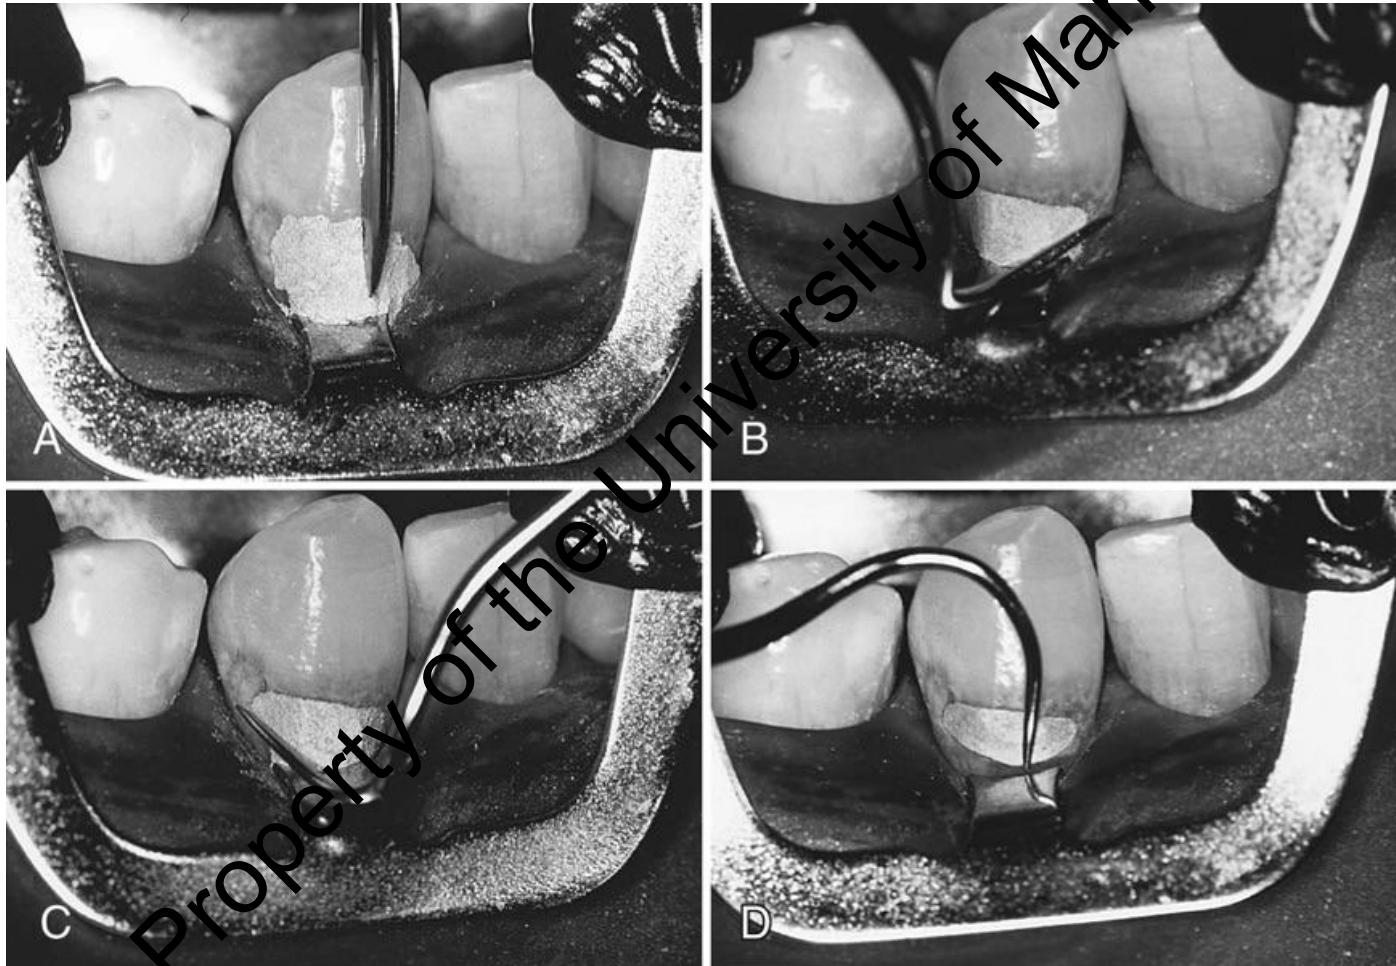

Gently floss through contact area
Check occlusion with articulating paper

Inserting amalgam. **A**, Place amalgam into the preparation in small increments. **B**, Condense first into the retention grooves with a small condenser. **C**, Condense against the mesial and distal walls. **D**, Overfill and provide sufficient bulk to allow for carving.

Carving and contouring the restoration. **A**, Begin the carving procedure by removing any excess and locating the incisal margin. **B** and **C**, An explorer may be used to remove the excess and locate the mesial and distal margins. **D**, Remove the excess and locate the gingival margin.

USE A LARGE CONDENSER OR A FLAT-BLADED INSTRUMENT TO OFFER RESISTANCE TO CONDENSATION PRESSURE APPLIED ELSEWHERE ON THE RESTORATION.

Disclosure of Commercial Support

- This program has not received any financial support from industry.
- This program has received financial support from *Company X* in the form of an unrestricted educational grant.
- This program has not received any gifts-in-kind from industry.
- This program has received in-kind support from *Company X* in the form of *donated equipment*.
- Potential for conflicts of interest:
 - *Speaker X* has received funding from an organization whose products are being discussed in this program.
 - *Company X* distributes a product that will be discussed in this program.

Mitigating Potential Bias

- This is where you would explain how potential sources of bias identified in the previous two slides have been mitigated.
- Eg. Speaker's slides were peer reviewed by someone with no connection to *Company X*.
- Eg.2 *Company X* had no control over course content.
